

Mid-term EX1 Solutions

1- Initial velocity = 10m/s, final velocity = 0, acceleration = -4m/s^2

Use the V^2 law to find Δx

2- Differentiate each equation to find the velocity of each car

Equalize the two velocities to find t

3- Initial velocity = $+4.9\text{m/s}$, final velocity = -14.7 , acceleration = -9.8m/s^2

Use the first equation of motion Table 2.2 but a changed to g

4- Initial velocity = 0, final velocity = ?, time = 2s, $\Delta x = 5\text{ m}$

Use the second equation of motion table 2.2

$$\begin{aligned} 5- \quad \mathbf{A} &= 3(5\mathbf{i} + 3\mathbf{j}) - (2\mathbf{i} + \mathbf{j} - 7\mathbf{k}) \\ &= 13\mathbf{i} + 10\mathbf{j} - 7\mathbf{k} \end{aligned}$$

$$\text{Magnitude of } \mathbf{A} = (13^2 + 10^2 + (-7)^2)^{1/2}$$

6- Radius $r = 2\text{ cm}$, 4rev/s , a?

$$T = 1/4 = 0.25\text{ s}$$

$$v = 2\pi r/T$$

$$a = v^2/r$$

7- along the x coordinate:

Initial velocity is = 0, $a = 4 \text{ m/s}^2$, $\Delta x = 32 \text{ m}$

Use the v^2 equation to find the final velocity

Use the final velocity to find the time t

The time t is a common factor between the motion along the x coordinates and the y coordinate

Now along the y coordinate:

Initial velocity is 8 m/s, $a = 2 \text{ m/s}^2$ and the time is calculated

Δy is found using the the third equation table 2.2

8- $v_{yi} = 0$, acceleration is 9.8 m/s^2 and $\Delta y = 400 \text{ m}$

Using the sign notation we can find the time t for the bomb to reach the ground

$$\Delta x = (300t) \text{ m}$$

$$9- \text{ Total distance} = 100 \times 5 \times 60 + 150 \times 10 \times 60 + 50 \times 5 \times 60 = 135000 \text{ m}$$

$$\text{Displacement: } R_x = 100 \times 5 \times 60 + 150 \times 10 \times 60 \cos 45$$

$$R_y = 150 \times 10 \times 60 \sin 45 - 50 \times 5 \times 60$$

$$\text{Tan } \theta = R_y / R_x$$
