

# Queue

---

By:  
Mr. Khaleifah Al.jada'  
Data Structures  
Al- Majma'ah Community College

## Introduction

---

- Queue is a British word for *line*.
- All access is restricted to the least recently inserted elements
- Basic operations are Append, Serve, Retrieve.

## Cont..

---

- Queue has two ends Front and Rear
- Front is used to retrieve and serve operations
- Rear is used to append

The principle of the queue is First In First Out ( FIFO ).

## Examples

---

- Line for bank's customers
- Line printer queue
- Expect  $O(1)$  time per queue operation because it is similar to stack.
- Queues are useful for storing pending work.

## Cont...

---

- There are several examples in computer science about queue:
  - Shortest paths problem (minimize the number of connecting flights between two arbitrary airports)
  - Topological ordering: given a sequence of *events*, and pairs  $(a,b)$  indicating that event *a* MUST occur prior to *b*, provide a schedule

5

## Implementation

---

- Queue can be implemented by using :
  - Array.
  - Linked List.
- The problem in array implementation occurs when we try to serve because all the remaining items in the queue must be shifted up.

By: Mr. Khaleifah AlJada'

6

## Example from A to Z

- After declaring a queue:

- After appending two items:

By: Mr. Khaleifah AlJada'

7

## Cont...

- Append another item:

- Serve an item:

8

## Class Linked Queue

---

```
class queue
{
    public:
        bool empty() const;
        bool serve();
        bool append(const Node_entry &item);
        bool retrieve(Node_entry &item) const;
        ~queue();
    private:
        Node * front, *rear;
};
```

By: Mr. Khaleifah AlJada'

9

## Methods

---

### Constructor:

```
queue::queue()
{
    front = rear = NULL;
}
```

### Empty:

```
bool queue::empty() const
{
    return rear == NULL;
}
```

By: Mr. Khaleifah AlJada'

10

## Cont..

---

- ***Append***

```
bool queue::append(const Node_entry &item)
{
    Node * new_node = new Node(item);
    if(new_node == NULL)
        return false;
    if(rear == NULL)
    {
        rear = new_node;
        front = new_node;
    }
}
```

By: Mr. Khaleifah AlJada'

11

## Cont..

---

```
    else
    {
        rear->next = new_node;
        rear = new_node;
    }
    return true;
}
```

By: Mr. Khaleifah AlJada'

12

## Cont...

---

### **Serve:**

```
bool queue::serve()
{
    if(rear == NULL)
        return false;
    else
    {
        Node *temp = front;
        front = front → next;
        delete temp;
    }
    return true;
}
```

By: Mr. Khaleifah AlJada'

13

## Cont..

---

### **Retrieve:**

```
bool queue::retrieve(Node_entry &item) const
{
    if( rear == NULL)
        return false;
    else
        item = front → entry;
    return true;
}
```

By: Mr. Khaleifah AlJada'

14

## Cont...

---

### **Destructor:**

```
queue::~~queue()  
{  
    while( !empty() )  
        serve();  
}
```

By: Mr. Khaleifah AlJada'

15

## Extra Functions

---

### **Function Full:**

```
bool Full() const  
{  
    Node *temp = new Node;  
    if(temp==NULL)  
        return true;  
    else  
        delete temp;  
    return false;  
}
```

By: Mr. Khaleifah AlJada'

16

## Cont..

---

### **Method Size:**

```
int Queue::size() const
{
    int count=0;
    Node *temp = front;
    while(temp != NULL)
    {
        count++;
        temp=temp->next;
    }
    return count;
}
```

By: Mr. Khaleifah AlJada'

17

## Cont..

---

### ■ **Function Clear:**

```
void clear(queue Q)
{
    while( ! Q.empty() )
        serve();
}
```

By: Mr. Khaleifah AlJada'

18

Cont...

***Method serve and retrieve:***

```
bool queue::serve_retrieve(Node_entry& item)
{
    if(empty())
        return false;
    item = front → entry;
    node * temp = front;
    front = front →next;
    delete temp;
    return true;
}
```
