

# KSU / CCIS / CS DEPARTMENT

---

## CSC-113, SPRING 2010

### LAB 5 – INHERITANCE

Implement the following classes in Java. Write a main class to test your program.

**Note:** The `toString()` method is actually defined in the `Object` class, and every class in Java inherits from `Object` class whether `extends` keyword is specified or not. The `toString()` method ( capable of converting Employee object into String) should be overridden in the different classes.
