

# Z - Transform

The z-transform is a very important tool in describing and analyzing digital systems.

It offers the techniques for digital filter design and frequency analysis of digital signals.

## Definition of z-transform:

$$X(z) = \sum_{n=-\infty}^{\infty} x[n]z^{-n}$$

Where  $z$  is a complex variable

For causal sequence,  $x(n) = 0, n < 0$ :

$$\begin{aligned} X(z) = Z(x(n)) &= \sum_{n=0}^{\infty} x(n)z^{-n} \\ &= x(0)z^{-0} + x(1)z^{-1} + x(2)z^{-2} + \dots \end{aligned}$$

All the values of  $z$  that make the summation to exist form a **region of convergence**.

# Example 1

**Problem:**

Given the sequence,  $x(n) = u(n)$ , find the z transform of  $x(n)$ .

**Solution:**

$$X(z) = \sum_{n=0}^{\infty} u(n)z^{-n} = \sum_{n=0}^{\infty} (z^{-1})^n = 1 + (z^{-1}) + (z^{-1})^2 + \dots$$

We know,  $1 + r + r^2 + \dots = \frac{1}{1-r}$  when  $|r| < 1$ .

Therefore,

$$X(z) = \frac{1}{1-z^{-1}} = \frac{1}{1-\frac{1}{z}} = \frac{z}{z-1}$$

**Region of convergence**

When,  $|z^{-1}| < 1 \Rightarrow |z| > 1$

# Example 2

**Problem:**

Given the sequence,  $x(n) = a^n u(n)$ , find the z transform of  $x(n)$ .

**Solution:**

$$X(z) = \sum_{n=0}^{\infty} a^n u(n) z^{-n} = \sum_{n=0}^{\infty} (az^{-1})^n = 1 + (az^{-1}) + (az^{-1})^2 + \dots$$

Therefore,

$$X(z) = \frac{1}{1 - az^{-1}} = \frac{1}{1 - \frac{a}{z}} = \frac{z}{z - a}$$

**Region of convergence**

When,  $|az^{-1}| < 1 \Rightarrow |z| > a$

# Z-Transform Table

Line No.	$x(n), n \geq 0$	$z$ -Transform $X(z)$	Region of Convergence
1	$x(n)$	$\sum_{n=0}^{\infty} x(n)z^{-n}$	
2	$\delta(n)$	1	$ z  > 0$
3	$au(n)$	$\frac{az}{z-1}$	$ z  > 1$
4	$nu(n)$	$\frac{z}{(z-1)^2}$	$ z  > 1$
5	$n^2u(n)$	$\frac{z(z+1)}{(z-1)^3}$	$ z  > 1$
6	$a^n u(n)$	$\frac{z}{z-a}$	$ z  >  a $
7	$e^{-na}u(n)$	$\frac{z}{(z-e^{-a})}$	$ z  > e^{-a}$
8	$na^n u(n)$	$\frac{az}{(z-a)^2}$	$ z  >  a $
9	$\sin(an)u(n)$	$\frac{z \sin(a)}{z^2 - 2z \cos(a) + 1}$	$ z  > 1$
10	$\cos(an)u(n)$	$\frac{z[z - \cos(a)]}{z^2 - 2z \cos(a) + 1}$	$ z  > 1$
11	$a^n \sin(bn)u(n)$	$\frac{[a \sin(b)]z}{z^2 - [2a \cos(b)]z + a^2}$	$ z  >  a $
12	$a^n \cos(bn)u(n)$	$\frac{z[z - a \cos(b)]}{z^2 - [2a \cos(b)]z + a^2}$	$ z  >  a $
13	$e^{-an} \sin(bn)u(n)$	$\frac{[e^{-a} \sin(b)]z}{z^2 - [2e^{-a} \cos(b)]z + e^{-2a}}$	$ z  > e^{-a}$
14	$e^{-an} \cos(bn)u(n)$	$\frac{z[z - e^{-a} \cos(b)]}{z^2 - [2e^{-a} \cos(b)]z + e^{-2a}}$	$ z  > e^{-a}$

# Example 3

## Problem:

Find z-transform of the following sequences.

a.  $x(n) = 10 \sin(0.25\pi n)u(n)$

b.  $x(n) = e^{-0.1n} \cos(0.25\pi n)u(n)$

## Solution:

a. From line 9 of the Table:

$$\begin{aligned} X(z) &= 10Z(\sin(0.2\pi n)u(n)) \\ &= \frac{10 \sin(0.25\pi)z}{z^2 - 2z \cos(0.25\pi) + 1} = \frac{7.07z}{z^2 - 1.414z + 1}. \end{aligned}$$

b. From line 14 of the Table:

$$\begin{aligned} X(z) &= Z(e^{-0.1n} \cos(0.25\pi n)u(n)) = \frac{z(z - e^{-0.1} \cos(0.25\pi))}{z^2 - 2e^{-0.1} \cos(0.25\pi)z + e^{-0.2}} \\ &= \frac{z(z - 0.6397)}{z^2 - 1.2794z + 0.8187}. \end{aligned}$$

# Z- Transform Properties (1)

**Linearity:**  $Z(ax_1(n) + bx_2(n)) = aZ(x_1(n)) + bZ(x_2(n))$

$a$  and  $b$  are arbitrary constants.

## Example 4

**Problem:**

Find z- transform of  $x(n) = u(n) - (0.5)^n u(n)$ .

**Solution:**

Using z- transform table:

$$\left\{ \begin{array}{ll} Z(u(n)) = \frac{z}{z-1} & \text{Line 3} \\ Z(0.5^n u(n)) = \frac{z}{z-0.5} & \text{Line 6} \end{array} \right.$$

Therefore, we get  $X(z) = \frac{z}{z-1} - \frac{z}{z-0.5}$ .

# Z- Transform Properties (2)

## Shift Theorem:

$$Z(x(n - m)) = z^{-m}X(z)$$

## Verification:

$$\begin{aligned} Z(x(n - m)) &= \sum_{n=0}^{\infty} x(n - m)z^{-n} \\ &= x(-m)z^{-0} + \dots + x(-1)z^{-(m-1)} + x(0)z^{-m} + x(1)z^{-m-1} + \dots \end{aligned}$$

$n = m$   
↓

Since  $x(n)$  is assumed to be causal:  $x(-m) = x(-m + 1) = \dots = x(-1) = 0$ .

Then we achieve,  $Z(x(n - m)) = x(0)z^{-m} + x(1)z^{-m-1} + x(2)z^{-m-2} + \dots$

$$\Rightarrow Z(x(n - m)) = z^{-m}(x(0) + x(1)z^{-1} + x(2)z^{-2} + \dots) = z^{-m}X(z).$$

# Example 5

## Problem:

Find z- transform of  $y(n) = (0.5)^{(n-5)} \cdot u(n-5)$ ,

where  $u(n-5) = 1$  for  $n \geq 5$  and  $u(n-5) = 0$  for  $n < 5$ .

## Solution:

Using shift theorem,

$$Y(z) = Z\left[(0.5)^{n-5} u(n-5)\right] = z^{-5} Z[(0.5)^n u(n)].$$

Using z- transform table, line 6:  $Y(z) = z^{-5} \cdot \frac{z}{z-0.5} = \frac{z^{-4}}{z-0.5}.$

# Z- Transform Properties (3)

## Convolution

In time domain,  $x(n) = x_1(n) * x_2(n) = \sum_{k=0}^{\infty} x_1(n-k)x_2(k)$ , Eq. (1)

In z- transform domain,

$$X(z) = X_1(z)X_2(z).$$

$$X(z) = Z(x(n)), X_1(z) = Z(x_1(n)), \text{ and } X_2(z) = Z(x_2(n)).$$

### Verification:

Using z- transform in Eq. (1)

$$X(z) = \sum_{n=0}^{\infty} x(n)z^{-n} = \sum_{n=0}^{\infty} \sum_{k=0}^{\infty} x_1(n-k)x_2(k)z^{-n}.$$

$$\Rightarrow X(z) = \sum_{n=0}^{\infty} \sum_{k=0}^{\infty} x_2(k)z^{-k}x_1(n-k)z^{-(n-k)} \Rightarrow X(z) = \sum_{k=0}^{\infty} x_2(k)z^{-k} \sum_{n=0}^{\infty} x_1(n-k)z^{-(n-k)}.$$

let  $m = n - k$ :

$$\Rightarrow X(z) = \sum_{k=0}^{\infty} x_2(k)z^{-k} \sum_{m=0}^{\infty} x_1(m)z^{-m} \Rightarrow X(z) = X_2(z)X_1(z) = X_1(z)X_2(z).$$

# Example 6

**Problem:** Given the sequences,

$$x_1(n) = 3\delta(n) + 2\delta(n - 1)$$

$$x_2(n) = 2\delta(n) - \delta(n - 1),$$

Find the z-transform of their convolution.

**Solution:**

Applying z-transform on the two sequences,

$$X_1(z) = 3 + 2z^{-1}$$

$$X_2(z) = 2 - z^{-1}.$$

From the table, line 2

Therefore we get,

$$\begin{aligned} X(z) &= X_1(z)X_2(z) = (3 + 2z^{-1})(2 - z^{-1}) \\ &= 6 + z^{-1} - 2z^{-2}. \end{aligned}$$

# Inverse z- Transform: Examples

Find inverse z-transform of  $X(z) = 2 + \frac{4z}{z-1} - \frac{z}{z-0.5}$

## Example 7

We get,  $x(n) = 2Z^{-1}(1) + 4Z^{-1}\left(\frac{z}{z-1}\right) - Z^{-1}\left(\frac{z}{z-0.5}\right)$

Using table,  $x(n) = 2\delta(n) + 4u(n) - (0.5)^n u(n)$ .

Find inverse z-transform of  $X(z) = \frac{5z}{(z-1)^2} - \frac{2z}{(z-0.5)^2}$

## Example 8

We get,  $x(n) = Z^{-1}\left(\frac{5z}{(z-1)^2}\right) - Z^{-1}\left(\frac{2z}{(z-0.5)^2}\right) = 5Z^{-1}\left(\frac{z}{(z-1)^2}\right) - \frac{2}{0.5}Z^{-1}\left(\frac{0.5z}{(z-0.5)^2}\right)$

Using table,  $x(n) = 5nu(n) - 4n(0.5)^n u(n)$ .

# Inverse z- Transform: Examples

Find inverse z-transform of  $X(z) = \frac{10z}{z^2 - z + 1}$

## Example 9

$$\text{Since, } X(z) = \frac{10z}{z^2 - z + 1} = \left( \frac{10}{\sin(a)} \right) \frac{\sin(a)z}{z^2 - 2z \cos(a) + 1}$$

By coefficient matching,  $-2 \cos(a) = -1$

Hence,  $\cos(a) = 0.5$ , and  $a = 60^\circ$   $\implies$   $\sin(a) = \sin(60^\circ) = 0.866$ .

$$\text{Therefore, } x(n) = \frac{10}{\sin(a)} Z^{-1} \left( \frac{\sin(a)z}{z^2 - 2z \cos(a) + 1} \right) = \frac{10}{0.866} \sin(n \cdot 60^\circ) = 11.547 \sin(n \cdot 60^\circ).$$

Find inverse z-transform of  $X(z) = \frac{z^{-4}}{z-1} + z^{-6} + \frac{z^{-3}}{z+0.5}$

## Example 10

$$x(n) = Z^{-1} \left( z^{-5} \frac{z}{z-1} \right) + Z^{-1} (z^{-6} \cdot 1) + Z^{-1} \left( z^{-4} \frac{z}{z+0.5} \right)$$

$$\implies x(n) = u(n-5) + \delta(n-6) + (-0.5)^{n-4} u(n-4).$$

# Inverse z-Transform: Using Partial Fraction

Problem:

$$\text{Find inverse z-transform of } X(z) = \frac{1}{(1 - z^{-1})(1 - 0.5z^{-1})}$$

Example 11

Solution:

First eliminate the negative power of z.

$$X(z) = \frac{z^2}{z^2(1 - z^{-1})(1 - 0.5z^{-1})} = \frac{z^2}{(z - 1)(z - 0.5)}$$

Dividing both sides by z:  $\frac{X(z)}{z} = \frac{z}{(z - 1)(z - 0.5)} = \frac{A}{(z - 1)} + \frac{B}{(z - 0.5)}$

Finding the constants:  $A = (z - 1) \frac{X(z)}{z} \Big|_{z=1} = \frac{z}{(z - 0.5)} \Big|_{z=1} = 2,$

$$B = (z - 0.5) \frac{X(z)}{z} \Big|_{z=0.5} = \frac{z}{(z - 1)} \Big|_{z=0.5} = -1$$

$$\frac{X(z)}{z} = \frac{2}{(z - 1)} + \frac{-1}{(z - 0.5)}$$

$$X(z) = \frac{2z}{(z - 1)} + \frac{-z}{(z - 0.5)}$$

Therefore, inverse z-transform is:  $x(n) = 2u(n) - (0.5)^n u(n).$

# Inverse z-Transform: Using Partial Fraction

Problem:

$$\text{Find } y(n) \text{ if } Y(z) = \frac{z^2(z+1)}{(z-1)(z^2-z+0.5)}$$

Example 12

Solution:

Dividing both sides by z:  $\frac{Y(z)}{z} = \frac{z(z+1)}{(z-1)(z^2-z+0.5)}$

$$\frac{Y(z)}{z} = \frac{B}{z-1} + \frac{A}{(z-0.5-j0.5)} + \frac{A^*}{(z-0.5+j0.5)}$$

We first find B:

$$B = (z-1) \frac{Y(z)}{z} \Big|_{z=1} = \frac{z(z+1)}{(z^2-z+0.5)} \Big|_{z=1} = \frac{1 \times (1+1)}{(1^2-1+0.5)} = 4.$$

Next find A:

$$A = (z-0.5-j0.5) \frac{Y(z)}{z} \Big|_{z=0.5+j0.5} = \frac{z(z+1)}{(z-1)(z-0.5+j0.5)} \Big|_{z=0.5+j0.5}$$

## Example 12 - contd.

$$A = \frac{(0.5 + j0.5)(0.5 + j0.5 + 1)}{(0.5 + j0.5 - 1)(0.5 + j0.5 - 0.5 + j0.5)} = \frac{(0.5 + j0.5)(1.5 + j0.5)}{(-0.5 + j0.5)j}$$

Using polar form

$$A = \frac{(0.707\angle 45^\circ)(1.58114\angle 18.43^\circ)}{(0.707\angle 135^\circ)(1\angle 90^\circ)} = 1.58114\angle -161.57^\circ$$

$$A^* = \bar{A} = 1.58114\angle 161.57^\circ.$$

$$P = 0.5 + 0.5j = |P|\angle\theta = 0.707\angle 45^\circ \text{ and } P^* = |P|\angle -\theta = 0.707\angle -45^\circ.$$

Now we have:

$$Y(z) = \frac{4z}{z-1} + \frac{Az}{z-P} + \frac{A^*z}{z-P^*}.$$

Therefore, the inverse z-transform is:

$$y(n) = 4Z^{-1}\left(\frac{z}{z-1}\right) + Z^{-1}\left(\frac{Az}{z-P} + \frac{A^*z}{z-P^*}\right)$$

$$\begin{aligned} y(n) &= 4u(n) + 2|A|(|P|)^n \cos(n\theta + \phi)u(n) \\ &= 4u(n) + 3.1623(0.7071)^n \cos(45^\circ n - 161.57^\circ)u(n) \end{aligned}$$

# Inverse z-Transform: Using Partial Fraction

Problem:

$$\text{Find } x(n) \text{ if } X(z) = \frac{z^2}{(z-1)(z-0.5)^2}.$$

Example 13

Solution:

Dividing both sides by z:

$$\frac{X(z)}{z} = \frac{z}{(z-1)(z-0.5)^2} = \frac{A}{z-1} + \frac{B}{z-0.5} + \frac{C}{(z-0.5)^2},$$

$$\text{where } A = (z-1) \frac{X(z)}{z} \Big|_{z=1} = \frac{z}{(z-0.5)^2} \Big|_{z=1} = 4.$$

$$\frac{R_m}{(z-p)} + \frac{R_{m-1}}{(z-p)^2} + \dots + \frac{R_1}{(z-p)^m} \qquad R_k = \frac{1}{(k-1)!} \frac{d^{k-1}}{dz^{k-1}} \left( (z-p)^m \frac{X(z)}{z} \right) \Big|_{z=p}$$

$$B = R_2 = \frac{1}{(2-1)!} \frac{d}{dz} \left\{ (z-0.5)^2 \frac{X(z)}{z} \right\} \Big|_{z=0.5} \quad \leftarrow \quad m = 2, p = 0.5$$

$$= \frac{d}{dz} \left( \frac{z}{z-1} \right) \Big|_{z=0.5} = \frac{-1}{(z-1)^2} \Big|_{z=0.5} = -4$$

## Example 13 - contd.

$$\begin{aligned} C = R_1 &= \frac{1}{(1-1)!} \frac{d^0}{dz^0} \left\{ (z-0.5)^2 \frac{X(z)}{z} \right\}_{z=0.5} \\ &= \left. \frac{z}{z-1} \right|_{z=0.5} = -1. \end{aligned}$$

Then  $X(z) = \frac{4z}{z-1} + \frac{-4z}{z-0.5} + \frac{-1z}{(z-0.5)^2}$ .

From Table:

$$Z^{-1} \left\{ \frac{z}{z-1} \right\} = u(n),$$

$$Z^{-1} \left\{ \frac{z}{z-0.5} \right\} = (0.5)^n u(n),$$

$$Z^{-1} \left\{ \frac{z}{(z-0.5)^2} \right\} = 2n(0.5)^n u(n).$$

Finally we get,

$$x(n) = 4u(n) - 4(0.5)^n u(n) - 2n(0.5)^n u(n).$$

# Partial Function Expansion Using MATLAB

Problem:

$$X(z) = \frac{1}{(1 - z^{-1})(1 - 0.5z^{-1})}$$

Example 14

Solution:

The denominator polynomial can be found using MATLAB:

```
>> conv([1 -1], [1 -0.5])  
D =  
1.0000 -1.5000 0.5000
```

Therefore,

$$X(z) = \frac{1}{(1 - z^{-1})(1 - 0.5z^{-1})} = \frac{1}{1 - 1.5z^{-1} + 0.5z^{-2}} = \frac{z^2}{z^2 - 1.5z + 0.5}$$

$$\text{and } \frac{X(z)}{z} = \frac{z}{z^2 - 1.5z + 0.5}$$

```
>> [R,P,K] = residue([1 0], [1 -1.5 0.5])
```

R =	P =	K =
2	1.0000	
-1	0.5000	

The solution is:

$$X(z) = \frac{2z}{z - 1} - \frac{z}{z - 0.5}$$

# Partial Function Expansion Using MATLAB

Problem:

$$Y(z) = \frac{z^2(z+1)}{(z-1)(z^2-z+0.5)}$$

Example 15

Solution:

```
>> N = conv([1 0 0], [1 1])
```

```
N =
```

```
1 1 0 0
```

```
>> D = conv([1 -1], [1 -1 0.5])
```

```
D =
```

```
1.0000 -2.0000 1.5000 -0.5000
```

$$Y(z) = \frac{z^2(z+1)}{(z-1)(z^2-z+0.5)} = \frac{z^3+z^2}{z^3-2z^2+1.5z-0.5}$$

and  $\frac{Y(z)}{z} = \frac{z^2+z}{z^3-2z^2+1.5z-0.5}$ .

```
>> [R,P,K] = residue([1 1 0], [1 -2 1.5 -0.5])
```

```
R =

$$X(z) = \frac{4z}{z-1} - \frac{4z}{z-0.5} - \frac{z}{(z-0.5)^2}$$

# Difference Equation Using Z-Transform

The procedure to solve difference equation using z-transform:

1. Apply z-transform to the difference equation.
2. Substitute the initial conditions.
3. Solve for the difference equation in z-transform domain.
4. Find the solution in time domain by applying the inverse z-transform.

# Example 17

## Problem:

Solve the difference equation when the initial condition is  $y(-1) = 1$ .

$$y(n) - 0.5y(n-1) = 5(0.2)^n u(n).$$

---

## Solution:

Taking z-transform on both sides:

$$Y(z) - 0.5(y(-1) + z^{-1}Y(z)) = 5Z(0.2^n u(n))$$

Substituting the initial condition and z-transform on right hand side using Table:

$$Y(z) - 0.5(1 + z^{-1}Y(z)) = 5z/(z - 0.2).$$

Arranging Y(z) on left hand side:

$$Y(z) - 0.5z^{-1}Y(z) = 0.5 + 5z/(z - 0.2).$$

$$\Rightarrow Y(z)(1 - 0.5z^{-1}) = (5.5z - 0.1)/(z - 0.2).$$

$$\Rightarrow Y(z) = \frac{(5.5z - 0.1)}{(1 - 0.5z^{-1})(z - 0.2)} = \frac{z(5.5z - 0.1)}{(z - 0.5)(z - 0.2)}$$

## Example 17 - contd.

$$\Rightarrow \frac{Y(z)}{z} = \frac{5.5z - 0.1}{(z - 0.5)(z - 0.2)} = \frac{A}{z - 0.5} + \frac{B}{z - 0.2},$$

Solving for A and B:

$$A = (z - 0.5) \frac{Y(z)}{z} \Big|_{z=0.5} = \frac{5.5z - 0.1}{z - 0.2} \Big|_{z=0.5} = \frac{5.5 \times 0.5 - 0.1}{0.5 - 0.2} = 8.8333,$$

$$B = (z - 0.2) \frac{Y(z)}{z} \Big|_{z=0.2} = \frac{5.5z - 0.1}{z - 0.5} \Big|_{z=0.2} = \frac{5.5 \times 0.2 - 0.1}{0.2 - 0.5} = -3.3333.$$

Therefore, 
$$Y(z) = \frac{8.8333z}{(z - 0.5)} + \frac{-3.3333z}{(z - 0.2)}$$

Taking inverse z-transform, we get the solution:

$$y(n) = 8.3333(0.5)^n u(n) - 3.3333(0.2)^n u(n)$$

# Example 18

## Problem:

A DSP system is described by the following differential equation with zero initial condition:

$$y(n) + 0.1y(n - 1) - 0.2y(n - 2) = x(n) + x(n - 1)$$

- Determine the impulse response  $y(n)$  due to the impulse sequence  $x(n) = \delta(n)$ .
- Determine system response  $y(n)$  due to the unit step function excitation, where  $u(n) = 1$  for  $n \geq 0$ .

---

## Solution:

Taking z-transform on both sides:

$$Y(z) + 0.1Y(z)z^{-1} - 0.2Y(z)z^{-2} = X(z) + X(z)z^{-1}$$

a.

Applying  $X(z) = Z(\delta(n)) = 1$  on right side

$$Y(z)(1 + 0.1z^{-1} - 0.2z^{-2}) = 1(1 + z^{-1})$$

$$\Rightarrow Y(z) = \frac{1 + z^{-1}}{1 + 0.1z^{-1} - 0.2z^{-2}}$$

# Example 18 - contd.

We multiply the numerator and denominator by  $z^2$

$$Y(z) = \frac{z^2 + z}{z^2 + 0.1z - 0.2} = \frac{z(z + 1)}{(z - 0.4)(z + 0.5)}$$

$$\frac{Y(z)}{z} = \frac{z + 1}{(z - 0.4)(z + 0.5)} = \frac{A}{z - 0.4} + \frac{B}{z + 0.5}$$

Solving for A and B:

$$A = (z - 0.4) \frac{Y(z)}{z} \Big|_{z=0.4} = \frac{z + 1}{z + 0.5} \Big|_{z=0.4} = \frac{0.4 + 1}{0.4 + 0.5} = 1.5556$$

$$B = (z + 0.5) \frac{Y(z)}{z} \Big|_{z=-0.5} = \frac{z + 1}{z - 0.4} \Big|_{z=-0.5} = \frac{-0.5 + 1}{-0.5 - 0.4} = -0.5556.$$

Therefore, 
$$Y(z) = \frac{1.5556z}{(z - 0.4)} + \frac{-0.5556z}{(z + 0.5)}$$

Hence the impulse response:

$$y(n) = 1.5556(0.4)^n u(n) - 0.5556(-0.5)^n u(n).$$

# Example 18 - contd.

b.

The input is step unit function:  $x(n) = u(n)$

Corresponding z-transform:  $X(z) = \frac{z}{z-1}$

$$Y(z) + 0.1Y(z)z^{-1} - 0.2Y(z)z^{-2} = X(z) + X(z)z^{-1} \quad [\text{Slide 24}]$$

$$Y(z) = \left(\frac{z}{z-1}\right) \left(\frac{1+z^{-1}}{1+0.1z^{-1}-0.2z^{-2}}\right) = \frac{z^2(z+1)}{(z-1)(z-0.4)(z+0.5)}$$

$$Y(z) = \frac{2.2222z}{z-1} + \frac{-1.0370z}{z-0.4} + \frac{-0.1852z}{z+0.5}$$

Do the middle steps by yourself!

$$y(n) = 2.2222u(n) - 1.0370(0.4)^n u(n) - 0.1852(-0.5)^n u(n).$$
