

Dilution of Solutions

Solutions:

- Understanding how to prepare solutions and make dilutions is an essential skill for **biochemists** which is necessary knowledge needed for doing any experiment.

- **What is SOLUTIONS ?**

A simple solution is basically two substances that are evenly mixed together.

- One of them is called the **solute** and the other is the **solvent**.
- Solution can be composed from **one or more** solute dissolved in a solvent forming a homogenous mixture.

- **Example:**

Solute → is the substance to be dissolved (sugar)

Solvent → is the one doing the dissolving (water)

Solutions

Solute + **solvent** → **solution**

The diagram shows the process of creating a solution. On the left, a pile of blue crystals is labeled "Solute". In the middle, a beaker containing clear liquid is labeled "water" and "solvent". An arrow points to the right, where a larger beaker contains a blue liquid labeled "solution".

Dilution of Solution :

□ **Dilution of solution:** means to add more solvent without the addition of more solute → To make it less concentrated.

1. Volume to volume dilutions (ratio).
2. Preparing dilutions by using the $V_1XC_1=V_2XC_2$ formula.
3. Serial Dilutions.

(1) Volume to volume dilutions (ratio):

- This type of dilutions describes the ratio of the **solute** to the **final volume** of the dilute solution.
- **For example:** to make 1:10 dilution of 1M NaCl solution, one part of the **1M NaCl** solution, should be mixed with nine parts of **water**, for a total of ten parts.

- Therefore 1:10 dilution means → 1 part of 1M NaCl + 9 parts of water.

- **Thus:**

→ if 10 ml of the 1:10 dilution was needed, then 1ml of 1M NaCl should be mixed with 9 ml of water.

→ if 100 ml of 1:10 dilution was needed, then 10 ml of the 1M NaCl should be mixed with 90 ml of water. [The final concentration of NaCl in both cases will be $0.1 \text{ M} (1/10) = 0.1$]

- **Example:**

Example:

How to Prepare 2:10 dilution of solution (A) with 7 M , but the total volume is 20ml not 10 ml?

how many ml of 7M solution A we need to make 20 ml of 2:10 A solution?

$$\begin{array}{ccc} 2 \text{ ml} & \rightarrow & 10 \text{ ml} \\ & \swarrow & \searrow \\ ? \text{ ml} & \rightarrow & 20 \text{ ml} \end{array}$$

$$= (2 \times 20) / 10 = 4 \text{ ml}$$

So,

So, 4 ml from solution (A) of 7 M is needed and complete volume up to 20 ml (adding 16 ml water).

Note: [16 ml water= 20 ml -4 ml].

How to Know the concentration of solution A after dilution?

First we will find the DILUTION FACTOR by the following :

Dilution factor (D.F) = final volume / aliquot volume

$$= 10/2 = 5$$

Then we will divide the stock concentration (before dilution) by the D.F:

$$7/5 = 1.4\text{M}$$

Note: To find out the stock concentration you will multiply the diluted concentration by the D.F

(2) Preparing dilutions by using the $V_1 \times C_1 = V_2 \times C_2$ formula:

- Sometimes it is necessary to use one solution to make a specific amount of a more dilute solution .
- **To do this the following formula can be used:**

$$V_1 \times C_1 = V_2 \times C_2$$

- Where:
 - V_1 = Volume of starting solution needed to make the new solution (volume of stock solution).
 - C_1 = Concentration of starting solution (stock solution).
 - V_2 = Final volume of new solution.
 - C_2 = Final concentration of new solution.

Example: Make 5ml of 0.25M solution from a 1.0M solution?

how many ml of 1M solution we need to make 5 ml of 0.25M solution?

$$\rightarrow V_1 \times C_1 = V_2 \times C_2$$

Where: $V_1 = ?$, $C_1 = 1M$, $V_2 = 5ml$, $C_2 = 0.25M$

$$\text{So: } (V_1) \times (1M) = (5ml) \times (0.25M)$$

$$\rightarrow V_1 = (5 \times 0.25) / 1 = \mathbf{1.25 \text{ ml}}$$

So 1.25ml of the 1M solution is needed (starting solution) then complete the volume up to 5 ml by diluent (generally water).

(3) Serial Dilutions :

- It is a stepwise dilution of a solution, where the **dilution factor is constant at each step.**
- The source of dilution material for each step comes from the diluted material of the previous step.

1:10

Dilution factor (D.F) = final volume / aliquot volume
= 10 / 1 = 10 (for each step)

$100 / 10 = 10$ $10 / 1 = 10$ $1 / 0.1 = 10$ $0.1 / 0.01 = 10$

Find out the concentration of the diluted solutions:

Dilution factor (D.F) = final volume / aliquot volume = 10 / 1 = **10** (for each step)

Example:

Starting with a 2.0 M stock solution of hydrochloric acid, prepare four standard solutions by serial dilution of the following Molarity respectively 1 M, 0.5 M, 0.25 M, 0.125 M. [with 1:2 dilution] ?

→ Dilution factor (D.F) = final volume / aliquot volume
= 2/1 = 2 → 1:2

-To prepare standard solution 1:

1 ml of the stock 2.0M solution is needed and volume made up to 2 ml with distilled water (never forget to mix properly).

-To prepare standard solutions 2-4:

1 ml of the previously diluted solution is taken and volume is made up to a final volume of 2 ml by the addition of distilled water.

how to calculate the concentration of the diluted solutions if they unknown ?

→ First: find the D.F:

Dilution factor (D.F) = final volume / aliquot volume
= 2/1 = 2

→ Second: divide the previous solution concentration by the D.F:

-concentration of solution 1 = 2.0 M stock solution / 2 = 1 M

-concentration of solution 2 = 1M/2 = 0.5 M

-concentration of solution 3 = 0.5M/2 = 0.25 M

-concentration of solution 4 = 0.25/2 = 0.125 M

Practical Part

Objectives:

- To get familiar with solution dilutions by different methods.

Method:

Solution dilutions:

(1).....

□ **Prepare 50ml with 1:20 dilution using the 0.08M NaOH solution you previously prepared.**

□ Calculation:

.....
.....

➔ To prepare the 1:20 dilutionml of the starting solution (0.08M NaOH) is needed and volume made up to a final volume ofml.

Method:

(2).....

□ **Prepare 100ml of 0.2M HCl from the previously 0.4M HCl solution you previously prepared.**

□ Calculation:

.....
.....

➔ To prepare the 0.2M HClml of the starting solution (0.4M HCl) is needed and volume made up to a total volume ofml by adding water.

Method:

(3).....

□ **Starting with a 3 M Copper Sulfate stock solution, prepare 8ml of four standard solutions (1 to 4) of the following Molarity respectively (dilution 2:8) :**

(1) M (2) M (3) M (4) M .

□ Calculation:

.....
.....

➔ To prepare standard solution 1: ml of the stock 2.0M solution is needed and volume made up to ml with distilled water.

➔ To prepare standard solution 2-4: ml of the previously diluted solution (8.00×10^{-2} M) is taken and volume is made up to a final volume of ml by the addition of distilled water.
