## Instructions

1. Show your university ID
2. Exam period is 3 hours.
3. This Exam consists of 9 pages with 6 questions; each question should not take more than 25 min on average.
4. The answer of each question is on the same page, use the back of the pages if you need more space.
5. Answer all questions and Show all your work in the answer
6. Turn off your cell phones

## Question \#1: Answer the following with True or False

|  | 1.Discrete event simulation is used to model systems that change over time in a <br> continuous manner. |
| :--- | :--- |
|  | 2.Inverse transform method requires the cumulative distribution function (CDF) to <br> generate random numbers from a probability distribution. |
|  | 3.The inverse transform method is only applicable for continuous probability <br> distributions |
|  | 4.Not always any distribution with CDF in functional form (closed form) has an <br> inverse transform. |
|  | 5.Discrete event simulation models the behavior of a system as a sequence of events <br> sorted by the time of occurrence. |
| 6.Inverse transform method doesn't require a random numbers generator from a <br> uniform distribution to have random values from a distribution |  |
| 7he inverse transform method is used to generate random variables with non- |  |
| negative values only. |  |

|  | 22. In Acceptance/Rejection method, we must have at least two $U(0,1)$ random number to give one random follows the function $f(x)$. |
| :---: | :---: |
|  | 23. The Mixture of Distributions Method works the same as the convolution method but with using all weights (wi) equal 1. |
|  | 24. In Acceptance/Rejection method, we accept the new number $w$ if the $\frac{g(w)}{f(w)}>u$ for $u \sim$ $\mathrm{U}(0,1)$. |
|  | 25. The function VLOOKUP in Excel always used to generate numbers from Normal distribution. |
|  | 26. The function RAND() in Excel is always gives numbers from Normal (0,1) |
|  | 27. It is always best to use simulation models to evaluate alternatives for complex or highly expensive systems. |
|  | 28. To generate one value of Erlang ( $\mathrm{k}=2, \lambda=3$ ) distribution we generate one value from Exponential $(\lambda=3)$ and multiply it with 2. |
|  | 29. We can always use RANDBETWEEN (a,b) to generate integer numbers between (a) and (b) with any the probability distribution for random variable between (a,b). |
|  | 30. If $\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{X}_{3}$ are random values generated from Shifted Exponential $(\lambda=3)$ with shift value $\delta=5$, then $\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{X}_{3}$ all values must be less than 5 . |
|  | 31. Any function in Excel end with ".INV" gives the inverse transform of random variable. |
|  | 32. We can determine number of simulation runs needed to make simulation results accurate by using confidence interval rule and a pilot sample from the simulation. |
|  | 33. The Function RANDBETWEEN $(\mathrm{a}, \mathrm{b})$ in Excel is used to generate continuous random number between $a$ and $b$. |

## Question \#2:

Customers arrive to a minimarket according to a Poisson process with arrival rate $\lambda=15$ customers per hour. The arriving customers come to a single server checkout counter after they finish shopping. It is estimated that the checkout sever takes a random amount of time to finish the checkout for a customer. The service time follows an exponential distribution with mean 5 minutes. The simulation output for 10 customers is in the following table:

| Col. 1 | Col. 2 | Col. 3 | Col. 4 | Col. 5 | Col. 6 | Col. 7 | Col. 8 | Col. 9 | Col. 10 | Col. 11 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \# \\ & \stackrel{\#}{\tilde{y}} \end{aligned}$ | $\begin{gathered} 7 \\ \underset{O}{5} \end{gathered}$ | Time between arrivals (min) | Arrival time (min) | $\begin{aligned} & 7 \\ & \stackrel{-}{0} \\ & \hline \end{aligned}$ | Service time (min) | Service start (min) | Cust. Wait? | Wait <br> Time <br> (min) | EXIT <br> time <br> (min) | Cashier Idle Time (min) |
| 1 | 0.059 | 0.24 | 0.24 | 0.105 | 0.33 | 0.24 | 0 | 0.00 | 0.58 | 0.24 |

| 5 | 0.550 | 3.19 | 12.58 | 0.755 | 4.22 | 16.81 | 1 | 4.23 | 21.03 | 0.00 |
| 6 | 0.342 | 1.67 | 14.26 | 0.377 | 1.42 | 21.03 | 1 | 6.77 | 22.45 | 0.00 |
| 7 | 0.716 | 5.03 | 19.29 | 0.152 | 0.49 | 22.45 | 1 | 3.16 | 22.94 | 0.00 |
| 8 | 0.554 | 3.23 | 22.52 | 0.399 | 1.53 | 22.94 | 1 | 0.42 | 24.47 | 0.00 |
| 9 | 0.742 | 5.42 | 27.94 | 0.527 | 2.25 | 27.94 | 0 | 0.00 | 30.19 | 3.48 |
| 10 | 0.918 | 10.01 | 37.96 | 0.415 | 1.61 | 37.96 | 0 | 0.00 | 39.56 | 7.77 |

Choose the correct answer:

| 1. Using Excel the values of col. 2 is generated by: <br> (a) using the function RANDBETWEEN $(0,1)$ <br> (b) using the function RAND(0 only <br> (c) using the function VIOOKUP |
| :---: |
| 2. The value of the arrival time for customer (3) is computed by: <br> (a) arrival time of Cust.(3) + time between Cust.(3) and Cust.(4) <br> (b) arrival time of Cust.(2) + time between Cust.(2) and Cust.(3) <br> (c) Departure time Cust.(2) + time between Cust.(2) and Cust.(3) |
| 3. Using Excel the values of col. 5 is generated by (a) using the function RANDBETWEEN $(0,1)$ <br> (b) using the function RAND() only <br> (c) using the function VlookUP |
| 4. The values of Col. 3 is computed in EXCEL by <br> (a) using the function RANDBETWEEN $(\mathrm{a}, \mathrm{b})$ <br> (b) the function $=(-60 / 15)^{*} \ln (1-\operatorname{RAND}())$ with Rand() from clo. 2 <br> (c) the function $=a+(b-a)^{*}($ RAND()) with Rand() from clo. 2 |
| 5. From the table, Col.\# 8 the waiting time of customer ( n ) is zero if: <br> (a) Cust.(n) arrival time is $\geq$ the departure (Exit) time of Cust.( $\mathrm{n}+1$ ) <br> (b) Cust.(n) arrival time is $\leq$ the departure (Exit) time of Cust.( $\mathrm{n}+1$ ) <br> (c) Cust.(n) arrival time is $\geq$ the departure (Exit) time of Cust.(n-1) |
| 6. From the table, the idle time of the server when customer ( n ) arrive is defined as: <br> (a) If Cust.(n) no wait then idle time $=0$ <br> (b) If Cust.(n) wait then idle time = Dep. Time Cust.(n-1) - Arrival time Cust(n) <br> (c) Both (a) and (b) |
| 7. Col. \# 8[Cust. Wait] is computed by the following condition: (a) If service start $=$ arrival time then (Cust. Wait?) $=0$ <br> (b) If service start > arrival time then (Cust. Wait?) $=1$ (c) Both (a) and (b) |
| 8. To compute the average waiting time from simulation table we use: <br> (a) SUM(Col. 9)/10 <br> (b) SUM(Col. 9)/(total simulation time) <br> (c) $\operatorname{SUM}($ Col. 8$) / 10$ |
| 9. The value of average waiting time in line is $=1.901$ <br> (a) average waiting time in line is $=0.6 \mathrm{~min}$ <br> (b) average waiting time in line is $=0.4804 \mathrm{~min}$ <br> (c) average waiting time in line is $=1.901 \mathrm{~min}$ |
| 10. From simulation, the percentage of customers who wait is <br> (a) Percentage of customers who wait in line $=40 \%$ <br> (b) Percentage of customers who wait in line $=60 \%$ <br> (c) Percentage of customers who wait in line $=100 \%$ |
| 11. The average number of arrivals in one hour is computed by; <br> (a) 60 (total arrivals)/ 10 <br> (b) 60 (total arrivals)/ (total simulation time) <br> (c) $60(1 / \lambda)$ |
| 12. The Service time for each customer in the table is computed by: <br> (a) $1-\operatorname{Exp}(\operatorname{Rand}(0 / 5)$ <br> (b) $(-60 / 5)^{*} \ln (1-\mathrm{RAND}())$ <br> (c) $(-5)^{*} \ln (1-\mathrm{RAND}())$ |
| 13. To commute probability that the cashier is IDLE we use: <br> (a) $\operatorname{SUM}($ Col.11)/ 10 <br> (b) $\operatorname{SUM}($ Col.11)/ (total simulation time) <br> (c) $1 / \operatorname{SUM}($ Col.11) |
| 14. From simulation table, the probability that the cashier is IDLE is equal to: <br> (a) probability cashier IDLE $=0.2995$ <br> (b) probability cashier IDLE $=1.185$ <br> (c) probability cashier IDLE $=0.6$ |

## Question \#3:

Consider the following probability random density functions for:

$$
\begin{aligned}
& f(x)=\frac{1}{3.11} e^{-\frac{1}{4}(x-4)} ; \quad 4 \leq x \leq 10 \\
& f(y)=\frac{2}{\beta^{2}} y e^{\left(\frac{y}{\beta}\right)^{2}} ; \beta=5 ; y>0
\end{aligned}
$$

(a) Compute the CDF of the function $f(x)$ and derive an inverse transform for this distribution.
(b) Compute the CDF of the function $f(y)$ and derive an inverse transform for this distribution.
(c) Let X (minutes) be the time between customers' arrival to a bank (integer values). Each customer takes a random amount of time ( Y ) minutes between $[4,15]$ until he leaves the bank with his service competed (integer values). Using $\mathrm{U}[0,1]$ random streams (take U 1 for X and U 2 for Y ), estimate average number of customer in bank per hour.

|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| U2 | 0.446 | 0.007 | 0.986 | 0.878 | 0.190 | 0.115 | 0.782 | 0.798 | 0.605 | 0.813 |
|  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |

## Question \# 4:

Consider the PDF function for the random variable X:

$$
f(x)= \begin{cases}2 \beta^{-2} x e^{\left(-(x / \beta)^{2}\right)} & x>0 \\ 0 & \text { otherwise }\end{cases}
$$

Let the parameter $\beta=3$. Answer the following:
(a) Derive an inverse transform algorithm for this distribution.
(b) Let X be the time between arrival of airplanes in an international an airport. There are three types of airplanes that land on the airport: ASA-100 with 100 seats, ASA- 300 with 300 seats or ASA-500 with 500 seats. The airplanes can be any of the tree types with equal probabilities. It is expected that number of empty seats in any airplane is randomly with discrete uniform between 5 and half of max. number of seats on airplane. Explain the simulation steps for Arrival Time of Airplane, Airplane Type, Empty Seats, Number of Passengers. Using the $U[0,1]$ random number in the following table, using the inverse transform in part (a) to determine the arrival time of the $1^{\text {st }}$ eight airplanes and the number of passengers on each one.

|  |  |  |  |  |  |  |  |  |

## Question \#5:

Consider a fish in a small square aquarium. The fish is monitored by a camera and record the movement of the fish in two dimensions ( $\mathrm{X}, \mathrm{Y}$ ). The fish moves randomly on specific points such that $X$ follows binomial distribution with parameters ( $n=5, p=0.45$ ) with shift 1 and $Y$ follows discrete uniform between 1 and 10 and each point remains a random amount of time follows an Erlang distribution with parameters $r=2$ and $\lambda=X$ per min.
(a) List all random processes in this system and define the simulation method for each processes.
(b) Simulate the movement of the fish for 10 min using the following $U[0,1]$ random streams.
(c) What is the average time that the fish remains in each point and the standard deviation.
(d) Given your results in (c), How many simulation moves we have to record in order to have a $99 \%$-C.I. with error less than $\mathrm{E} \leq 0.01\left(\mathrm{Z}_{\alpha}=2.32, \mathrm{Z}_{0.5 \alpha}=2.58, \mathrm{Z}_{0.25 \alpha}=3.29\right)$

| Move \# | U1 | $\mathbf{X}$ | U2 | $\mathbf{Y}$ | U3 | U4 | U5 | $\mathbf{T}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Question \#6:

A bus driver is taking tourists on a tour every day on his own bus to visit 3 major cities: City-A, CityB, City-C. During the tour, the bus may breakdown between cities. If the bus breaks down, it needs a repair time which is a random variable as shown in the following table. The travel time between cities is an exponential. The table below shows the mean travel time, the shift parameter, probability of breakdown and the mean repair time if the bus breakdown on the road. The repair time is exponential distribution.

| from-to | Mean Travel <br> Time | Probability of <br> break down | Repair Time Dist. <br> (hours) |
| :---: | :---: | :---: | :---: |
| A to B | 1 hours | 0.4 | shifted exponential with $\delta=2$ and $\lambda=0.5$ |
| B to C | 2.5 hours | 0.35 | Discrete Uniform[3,5] |
| C to A | 3 hours | 0.45 | Erlang Dist. $k=2, \lambda=0.75$ |

(a) Write the steps and functions to simulate to the total travel time for the tour. (explain your answers fully)
(b) Do the simulation of the tour for five days using the $U[0,1]$ in the table.
(c) From the simulation output, what is the average travel time of the tour
(d) From the simulation output, what is average number of breakdowns.
(e) If you take a tour on that bus and the tour started at 8:00 am. From the simulation output, estimate the probability that you will come back after the tour before 7:00 pm.

## Question \#7: (Cont.)

Write the simulation results in the following table:

| Day\# |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| U | 0.328 | 0.708 | 0.027 | 0.653 | 0.283 | 0.113 | 0.662 | 0.701 | 0.328 |  |
| $\mathbf{1}$ |  |  |  |  |  |  |  |  |  |  |
| U | 0.554 | 0.64 | 0.11 | 0.863 | 0.566 | 0.306 | 0.192 | 0.083 | 0.554 |  |
| $\mathbf{2}$ |  |  |  |  |  |  |  |  |  |  |
| $\mathbf{U}$ | 0.96 | 0.047 | 0.468 | 0.281 | 0.332 | 0.281 | 0.053 | 0.974 | 0.16 |  |
| $\mathbf{3}$ |  |  |  |  |  |  |  |  |  |  |
| $\mathbf{U}$ | 0.37 | 0.543 | 0.978 | 0.067 | 0.732 | 0.852 | 0.891 | 0.287 | 0.37 |  |
| $\mathbf{4}$ |  |  |  |  |  |  |  |  |  |  |
| $\mathbf{U}$ | 0.485 | 0.389 | 0.601 | 0.374 | 0.808 | 0.527 | 0.533 | 0.532 | 0.485 |  |
| $\mathbf{5}$ |  |  |  |  |  |  |  |  |  |  |
