# **Question #1: Simulations Modeling**

Consider a bank with multiple number of servers. The manager is receiving many complains about the long waiting time in line. He decided to hire a simulation analyst to model this system and give his suggestions. The following steps and processes are done to model the system. To model the system the Analyst executed the following processes:

- checking if the system and the problem is understood correctly.
- Building the functions and logic between the behavior of customers in line.
- Gathering a sample of service time of each customer.
- Writing the functions and relations in Arena
- Writing the mathematical relations logic on Excel.
- 6. Checking if the Arena program computes and give numbers when it runs
- Discovering that the results give departure value of 3rd arrival less than the departure time of the 2nd arrival.
- Determining the parameters needed for the model.
- Reviewing the data in the e-system of the bank
- 10. Collecting a sample of the arrival time of each arrival.
- 11. The output results of the simulation model match exactly the behavior of the customers in the system.
- 12. Determining if the manager of the system wants to increase the efficiency and quality of service or to reduce cost.
- Determining the time that will be required, personnel that will be used, hardware and software requirements.
- Based on the analysis of runs that have been completed, the simulation analyst determines if additional runs are needed and if any additional scenarios need to be simulated.
- 15. The result of all the analysis written in a report that is clear to help enable the management to review the final formulation and the alternatives.
- 16. The simulation analyst acts as a reporter to present the best solution and how it will affect the performance of the system.
- 17. meeting with the manager, the servers and the customers to fully understand the system and its details
- 18. Deciding the arrival pattern of the customers to the bank and choosing the distribution of the service time.
- 19. Experimenting with simulation model by trying different scenarios in the simulation model and choosing the best one.

20. Doing a long production runs for the best alternative and do data analysis to estimate final measures of performance for the scenarios that are being simulated.

Put the number of the processes above in the correct stage in simulation modeling methodology. The number of the process should appear one time only.

1. Problem formulation  2. Setting objectives and overall plan  3. Model conceptualization  4. Data collection  5. Model translation  6. Verifying the Simulation Code  7. ## OR 441 - Modeling and Simulation

Dr. Khalid Alnowibet

#### **Question #2:**

Consider the continuous random Y with the following pdf:

- a) Write the cumulative distribution function of  $f_Y(y)$  and compute the expected value of Y?
- $f_Y(y) = \begin{cases} 0, & y < 0 \\ 0.2y, & 0 \le y \le 1 \\ 0.1 + 0.1y, & 1 < y \le 2 \\ 0.25 + 0.025y, & 2 < y \le 4 \\ 0, & y > 4. \end{cases}$
- b) Write the Inverse transform for  $f_Y(y)$ ?
- c) Write the algorithm for generating 10 random numbers from  $f_Y(y)$ .
- d) Let Y be the time (in hourse) for surgery in an Operations Room (OR) in K.A.N Hospital. The hospital has one Operations Room. Patients are transferred to the OR according to a Poisson Process with average time between arrivals equals to 5 hours. The operations Room work 24 hours per day. Define the simulation model for the OR and apply it for 5 patients. Use the following U[0,1] numbers as needed. Starting simulations time is zero.

$F(y) = P^{y}$	Move by rows →	0.744 0.256	0.443 0.542	0.820 0.844	0.166

## **Question #3:**

The period of time (in months) between rainfalls in Abha city is modeled using the following pdf:

$$f(x) = 1.06 e^{\frac{-x}{2}}$$
 ;  $1 \le x \le 4$ 

Where random variable X is time between rainfalls in months.

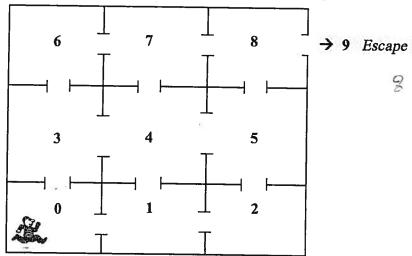

- a) Write the inverse transform for measuring the time between rainfalls.
- b) Simulate the next 4 rainfalls (in months) in Abha city.
- c) If the we want to simulate the rainfall that is at least two months from now. Write the inverse transform and give two simulated values.
- d) Write the algorithm for applying Acceptance/Rejection method for the pdf f(x).
- e) Using the following U[0,1] as needed, generate **three** random numbers from f(x) using the acceptance/rejection method.

acc	eptance/rejecti	on method.	Move by	•	
1) 15	1.06 ex	- dx	rows —	0.744 0.256 0.744	0.443 0.542 0.444

Dr. Khalid Alnowibet

## Question #4:

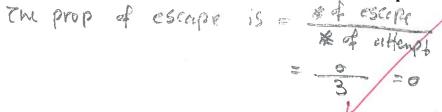

Consider an escaped prisoner who entered in a maze. The maze contains 8 chambers. If the prisoner enters any chamber he is equally likely to choose any door in the chamber (including the door he entered through). The prisoner has no time to waste, he has only 5 moves to escape out starting from chamber 0 before he gets caught up and put back into the prison.

- a) Write the algorithm for generating the moves of the prisoner.
- b) Using your answer in (a), Simulate the path of the prisoner for 5 attempts in the following table

	Move-1	Move-2	Move-3	Move-4	Move-5	Move-6
Attept#1	0.3328	0.7665	0.9796	0.1070	0.1514	0.6884
Chambers	1	Ч	7	W		3
Attept#2	0.8479	0.1445	0.0851	0.3078	0.5483	0.9579
Chambers	3	0	1/	Ō	3	6
Attept#3	0.7371	0.4837	0.3936	0.1464	0.9872	0.1820
Chambers	3	4,/	3	ð	3	0

.c) From the simulation results in part (b), what is the estimate for probability of escape.

#### Question #5:

( ) L .... > 1=5

Airplanes land on a small airport according to Poisson process with rate 5 airplanes per day. Also, the airplanes depart from the same airport at rate 4 air planes per day according to a Poisson process. Assume that the airport works 18 hours.

1. Give a random number for total number of air planes landed in the airport on one working day using the following U[0,1] numbers as needed. (Answer on the back of the page)

								U-)		
n	1	2	3	4	5	6	7	8	9	10
$U_n(0,1)$	0.171	0.023	0.879	0.305	0.696	0.415	0.721	0.901	0.344	0.051

2. Give a random generation for the time of **the last airplane departed** from the airport on one day using the following U[0,1] numbers **as needed**.

n	1	2	3	4	5	6	7	8	9	10
$U_n(0,1)$	0.815	0.636	0.563	0.923	0.295	0.605	0.971	0.023	0.879	0.305

3. According to Poisson process the percentage of departing airplanes from the airport is 44.5%. Make a discrete event simulation run of the airport for 12 hours. Write the simulation algorithm for this system and use it with the following U[0,1] as needed. (Answer on the back of the page)

-	40.00	944000000000000000000000000000000000000		o [o,1] as nee		ver on the but	ck of the page)
