## 2nd Assignment (April 2020)

استعن بالنه وكن على يقين بأن كل ما ورد في هذه الورةة تعرفه جيدا وقد تدربت كليه با فيه الكفية

## Instruction and guides for the assignment:

1. This assignment is designed to guide you to understand fully the topics and practice covered in the $1^{\text {st }}$ month of the course.
2. To give you plenty of time to review and apply the materials for the answer, the assignment duration is from 4:00pm Thursday April 9,2020 until 12:00 noon Friday Apr. 10
3. You can use the lecture notes, the text book, Excel for your answer.
4. Make sure to indicate the source of the information in you answer.
5. You are the guardian of your behavior in this assignment. This assignment is totally for your independent effort. Do not attempt to collaboration or communication with anyone about the questions of the assignment, it is totally not allowed by any means.
6. Write your answers on a word document and email the document on PDF and WORD format. Write the subject of the email as:

OPER-441-Assignment\#1 <<Section Number>>, << your name>> , <<your KSU ID >>
7. Put all you of answers in one document. If you have part of the answers on excel, capture the answer from the screen and insert it in the document.
8. Make your answers as comprehensive in information as much as you can, write all information related to the answers. There will be Extra Marks for that>
9. Make sure to make your document as organized as possible, there will be Extra Marks for the organization.
وفقكم الله ويسر لكم .. وحفظكم ورعاكم

## Question \#1:

A traffic department of a small city wants to simulate the occurrence time for the accident in an intersection using some different choices of distributions to estimate the number of accidents per month ( 30 days). Use the following $U(0,1)$ numbers to compute the simulation under the following assumptions.

1. Estimate the number of accidents in the $1^{\text {st }}$ month assuming the time between accident is an exponential distribution with mean 5 days.
2. Estimate the number of accidents in the $1^{\text {st }}$ month assuming The time between accident is an Erlang distribution with parameter $r=3$ and $\lambda=0.2$ accident/day
3. Estimate the number of accidents in the $1^{\text {st }}$ month assuming The time between accident is shifted Binomial distribution with minimum value 3 and parameters $n=5$ and $p=0.6$.
4. Estimate the number of accidents in the $1^{\text {st }}$ month assuming that the time between accident is taken as in part (1) with chance $40 \%$ or as in part (2) with chance $60 \%$.

## Use uniform numbers (as needed) by columns until you finish all numbers in the column then move to the next.

| $\downarrow 0.420$ | $\downarrow 0.245$ | $\downarrow 0.299$ | $\downarrow 0.464$ | $\downarrow 0.534$ | $\downarrow 0.141$ | $\downarrow 0.293$ | $\downarrow 0.689$ | $\downarrow 0.349$ |

## Question \#2:

An insurance company has a customer care calling center to process their claims. Assume that claims arrive to the calling center according to a random process. The time between calls (in minutes) is assumed to follow the Geometric distribution with mean 25 minutes.

$$
f(x)=(1-p) p^{x} \quad ; \quad x=0,1,2, \ldots
$$

From past data, it is found that the claim value distributed as follows:

| Claim <br> Amount | $5000 \leq \mathrm{X}<10000$ | $10000 \leq \mathrm{X}<15000$ | $15000 \leq \mathrm{X}<20000$ | $20000 \leq \mathrm{X}$ |
| :---: | :---: | :---: | :---: | :---: |
| Percentage | $30 \%$ | $40 \%$ | $20 \%$ | $10 \%$ |

The exact amount within any category is assumed to be discrete uniform. The work hours for the call center is between 6 am to 6 pm every day.

1. Write the algorithm for simulating the arrival of a call for a claim.
2. Write the algorithm for simulating the amount of the claim
3. Simulate the call arrival time and the claim amount for 5 days using the following uniform $(0,1)$ numbers (use as needed) and your answers in $(\mathbf{1}, \mathbf{2})$.

| Day-1 |  |  | Day-2 |  |  | Day-3 |  |  | Day-4 |  |  | Day-5 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| U1 | U2 | U3 | U1 | U2 | U3 | U1 | U2 | U3 | U1 | U2 | U3 | U1 | U2 | U3 |

## Question \#3:

Consider a continuous variable X in days that represents the length of stay (LOS) for patients in a hospital. It is assumed that LOS (in days) is a continuous random variable following the Weibull distribution with parameters $\alpha=2$ and $\beta=4$ having the following $p d f$ :

$$
f(x)=\frac{2}{16} x e^{-\frac{x^{2}}{16}} \quad ; x>0
$$

1. Find the CDF function of $f(x)$ and then find the inverse transform for generating random numbers from $f(x)$.
2. Compute the average and standard deviation of LOS, by simulating the length of stay for 50 patients using the following uniform $(0,1)$ numbers (use as needed) and your answer in (1) to compute.

| $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.590 | 0.190 | 0.994 | 0.162 | 0.817 | 0.839 | 0.893 | 0.748 | 0.633 | 0.485 |
| 0.019 | 0.421 | 0.603 | 0.123 | 0.993 | 0.571 | 0.001 | 0.154 | 0.548 | 0.614 |
| 0.023 | 0.932 | 0.362 | 0.022 | 0.630 | 0.502 | 0.278 | 0.684 | 0.323 | 0.939 |
| 0.058 | 0.541 | 0.800 | 0.373 | 0.686 | 0.644 | 0.024 | 0.500 | 0.221 | 0.032 |
| 0.164 | 0.063 | 0.891 | 0.252 | 0.925 | 0.091 | 0.693 | 0.939 | 0.803 | 0.024 |

3. Now, assume that LOS for any patient is at least half a day. Find the new inverse transform for generating random numbers from $f(x)$. Then, us it to compute the length of stay for 50 patients using the following uniform $(0,1)$ numbers (use as needed).

| $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.675 | 0.865 | 0.584 | 0.774 | 0.639 | 0.871 | 0.759 | 0.458 | 0.895 | 0.881 |
| 0.991 | 0.107 | 0.382 | 0.751 | 0.122 | 0.661 | 0.908 | 0.728 | 0.733 | 0.296 |
| 0.419 | 0.043 | 0.136 | 0.495 | 0.976 | 0.478 | 0.550 | 0.687 | 0.502 | 0.658 |
| 0.278 | 0.101 | 0.198 | 0.635 | 0.248 | 0.517 | 0.783 | 0.666 | 0.707 | 0.959 |
| 0.737 | 0.158 | 0.498 | 0.252 | 0.310 | 0.919 | 0.044 | 0.726 | 0.301 | 0.172 |

4. Assume that LOS for any patient is at least $Y$ days. Where $Y$ is a random variable following the Exponential distribution with mean half a day. Find the new inverse transform for generating random numbers from $f(x)$. Then, compute the average and standard deviation of LOS, by simulating the length of stay for 50 patients using the uniform $(0,1)$ numbers in part (2) for $X$ and the uniform random numbers in part (3) for $Y$.
5. Some patients are known to have a medical condition that requires them to stay a random length of stay between a minimum of 0.5 day up to 5 days maximum. Write the inverse transform for generating random numbers from $f(x)$ under this condition.
6. Compute the average LOS of patients in part (5), by simulating the length of stay for 50 patients using the following uniform ( 0,1 ) numbers (use as needed) and your answer in (5) to compute.

| $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.796 | 0.957 | 0.622 | 0.074 | 0.539 | 0.012 | 0.377 | 0.972 | 0.256 | 0.697 |
| 0.216 | 0.937 | 0.891 | 0.456 | 0.623 | 0.192 | 0.278 | 0.304 | 0.654 | 0.043 |
| 0.374 | 0.003 | 0.759 | 0.389 | 0.638 | 0.313 | 0.019 | 0.952 | 0.643 | 0.854 |
| 0.058 | 0.541 | 0.800 | 0.373 | 0.686 | 0.644 | 0.024 | 0.500 | 0.221 | 0.032 |
| 0.164 | 0.063 | 0.891 | 0.252 | 0.925 | 0.091 | 0.693 | 0.939 | 0.803 | 0.024 |

## Question \#4:

Consider a continuous random variable with the following pdf:

$$
f(x)= \begin{cases}\frac{1}{2} & 0 \leq x \leq 1 \\ \frac{3}{4}-\frac{x}{4} & 1 \leq x \leq 3\end{cases}
$$

(a) Construct the algorithm for obtaining random numbers from $f(x)$ using the inverse transform method.
(b) Using your answer in (a), give 10 random numbers from $f(x)$ using the following uniform numbers.

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.387 | 0.336 | 0.466 | 0.074 | 0.184 | 0.336 | 0.900 | 0.875 | 0.475 | 0.636 |
|  |  |  |  |  |  |  |  |  |  |

(c) Assume that the variable X represents the time between arrival to a service station (in hours). The station work hours are from 8 am to 3 pm . The owner wants to determine the expected number arrivals per day using simulation output for 5 days. Using the following uniform numbers for each day, estimate the average number of arrivals per day.

|  | Day-1 | Day-2 | Day-3 | Day-4 | Day-5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | 0.194 | 0.489 | 0.029 | 0.381 | 0.068 |
| $\mathbf{2}$ | 0.790 | 0.300 | 0.800 | 0.353 | 0.256 |
| $\mathbf{3}$ | 0.084 | 0.791 | 0.764 | 0.906 | 0.737 |
| $\mathbf{4}$ | 0.111 | 0.918 | 0.553 | 0.579 | 0.327 |
| $\mathbf{5}$ | 0.954 | 0.638 | 0.452 | 0.365 | 0.856 |
| $\mathbf{6}$ | 0.723 | 0.890 | 0.744 | 0.760 | 0.434 |
| $\mathbf{7}$ | 0.551 | 0.079 | 0.139 | 0.488 | 0.778 |
| $\mathbf{8}$ | 0.919 | 0.926 | 0.281 | 0.799 | 0.930 |
| $\mathbf{9}$ | 0.337 | 0.310 | 0.384 | 0.245 | 0.755 |
| $\mathbf{1 0}$ | 0.831 | 0.086 | 0.100 | 0.088 | 0.589 |

## Question \#5:

Consider a continuous random variable with the following pdf:

$$
f(x)= \begin{cases}\frac{x}{8}-\frac{1}{4} & 2 \leq x \leq 4 \\ \frac{10}{24}-\frac{x}{24} & 4 \leq x \leq 10\end{cases}
$$

|  |  |  | u | v |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | 0.194 | 0.381 |
| (a) | Construct the algorithm for obtaining random numbers | 2 | 0.790 | 0.353 |
|  | from $f(x)$ using the acceptance-rejection method using | 3 | 0.084 | 0.906 |
|  |  | 4 | 0.111 | 0.579 |
|  | majorizing function $\mathrm{g}(\mathrm{x})=\max \mathrm{f}(\mathrm{x})$. | 5 | 0.954 | 0.365 |
|  |  | 6 | 0.723 | 0.760 |
| (b) | Using your answer in (a), give 10 random numbers from | 7 | 0.551 | 0.488 |
|  | $f(x)$ using the following uniform numbers (as needed). | 8 | 0.919 | 0.799 |
|  |  | 9 | 0.337 | 0.245 |
|  |  | 10 | 0.831 | 0.088 |
|  |  | 11 | 0.489 | 0.029 |
|  |  | 12 | 0.300 | 0.800 |
|  |  | 13 | 0.791 | 0.764 |
|  |  | 14 | 0.918 | 0.553 |
|  |  | 15 | 0.638 | 0.452 |
|  |  | 16 | 0.890 | 0.744 |
|  |  | 17 | 0.079 | 0.139 |
|  |  | 18 | 0.926 | 0.281 |
|  |  | 19 | 0.310 | 0.384 |
|  |  | 20 | 0.086 | 0.100 |

## $2^{\text {nd }}$ Assignment (April 2020)

## Instruction and guides for the assignment:

1. This assignment is designed to guide you to understand fully the topics and practice covered in the $1^{\text {st month }}$ of the course.
2. To give you plenty of time to review and apply the materials for the answer, the assignment duration is from 4:00pm Thursday April 9,2020 until 12:00 noon Friday Apr. 10
3. You can use the lecture notes, the text book, Excel for your answer.
4. Make sure to indicate the source of the information in you answer.
5. You are the guardian of your behavior in this assignment. This assignment is totally for your independent effort. Do not attempt to collaboration or communication with anyone about the questions of the assignment, it is totally not allowed by any means.
6. Write your answers on a word document and email the document on PDF and WORD format. Write the subject of the email as:

OPER-441-Assignment\#1 <<Section Number>>, << your name>>, <<your KSU ID >>
7. Put all you of answers in one document. If you have part of the answers on excel, capture the answer from the screen and insert it in the document.
8. Make your answers as comprehensive in information as much as you can, write all information related to the answers. There will be Extra Marks for that>
9. Make sure to make your document as organized as possible, there will be Extra Marks for the organization.

## Ouestion \#1:

A traffic department of a small city wants to simulate the occurrence time for the accident in an intersection using some different choices of distributions to estimate the number of accidents per month ( 30 days). Use the following $U(0,1)$ numbers to compute the simulation under the following assumptions.

1. Estimate the number of accidents in the $1^{\text {st month }}$ assuming the time between accident is an exponential distribution with mean 5 days.

$$
\mathrm{T}_{\mathrm{n}} \sim \operatorname{Exp}(1 / 5)
$$

$$
F^{-1}(u)=-5 \ln (1-u)
$$

$A T_{n}=T_{n}+A T_{n-1}$

| $\mathbf{U}$ | $\mathbf{T n}$ | $\boldsymbol{A T n}$ |
| :---: | ---: | :---: |
| 0.42 | 2.7236 | 2.723636 |
| 0.737 | 6.678 | 9.401642 |
| 0.293 | 1.7336 | 11.13527 |
| 0.136 | 0.7309 | 11.86618 |
| 0.848 | 9.4194 | 21.28555 |
| 0.692 | 5.8883 | 27.17383 |
| 0.727 | 6.4914 | 33.66525 |

2. Estimate the number of accidents in the $1^{\text {st month }}$ assuming The time between accident is an Erlang distribution with parameter $\mathrm{r}=3$ and $\square=0.2$ accident/day.

$$
\mathrm{T}_{\mathrm{n}} \sim \text { Erlang }(3,0.2)
$$

$$
\mathrm{F}^{-1}(\mathrm{u})=-\frac{1}{2} \ln \left(1-\mathrm{u}_{1}\right)+-\frac{1}{2} \ln \left(1-\mathrm{u}_{2}\right)+-\frac{1}{2} \ln \left(1-\mathrm{u}_{3}\right)
$$

$$
A T_{n}=T_{n}+A T_{n-1}
$$

| U1 | U2 | U3 | Tn | ATn |
| :---: | :---: | :---: | :---: | :---: |
| 0.116 | 0.074 | 0.262 | 2.519954 | 2.519954 |

## Ouestion

## \#2:

An insurance company has a customer care calling center to process their claims. Assume that claims arrive to the calling center according to a random process. The time between calls (in minutes) is assumed to follow the Geometric distribution with mean 25 minutes.

$$
(x)=(1-p)^{x} p^{;} x=0,1,2, \ldots
$$

From past data, it is found that the claim value distributed as follows:

| Claim <br> Amount | $5000 \leq \mathrm{X}<10000$ | $10000 \leq \mathrm{X}<15000$ | $15000 \leq \mathrm{X}<20000$ | $20000 \leq \mathrm{X}$ |
| :---: | :---: | :---: | :---: | :---: |
| Percentage | $30 \%$ | $40 \%$ | $20 \%$ | $10 \%$ |

The exact amount within any category is assumed to be discrete uniform. The work hours for the call center is between 6 am to 6 pm every day.

1. Write the algorithm for simulating the arrival of a call for a claim.
$\frac{1-P}{P}=25 \rightarrow P=0.038$
TBC~Geometric (0.038)
$\mathrm{F}^{-1}(\mathrm{u})=\left\lfloor\frac{L N(1-U)}{L N(1-0.038)}\right\rfloor$
$\mathrm{AT}_{\mathrm{n}}=\mathrm{TBC}+\mathrm{AT}_{\mathrm{n}-1}$
2. Write the algorithm for simulating the amount of the claim Amount of claim $\sim$ Discrete uniform $\mathrm{F}^{-1}(\mathrm{u})=\mathrm{a}+(\mathrm{b}-\mathrm{a}){ }^{*} \mathrm{u}$

Interval $=\left\{\begin{array}{lr}1 & 0 \leq u \leq 0.3 \\ 2 & 0.3<u \leq 0.7 \\ 3 & 0.7<u \leq 0.9 \\ 4 & 0.9<u \leq 1\end{array}\right.$
Amount of claim $= \begin{cases}5000+5000 u & \text { Interval }=1 \\ 10000+5000 u & \text { Interval }=2 \\ 15000+5000 u & \text { Interval }=3 \\ 20000+5000 u & \text { Interval }=4\end{cases}$
3. Simulate the call arrival time and the claim amount for 5 days using the following uniform $(0,1)$ numbers (use as needed) and your answers in $(\mathbf{1 , 2})$.

| Day-1 |  |  |  | Day-2 |  |  |  | Day-3 |  |  |  | Day-4 |  |  |  | Day-5 |  |  |  |

## Question \#3:

Consider a continuous variable X in days that represents the length of stay (LOS) for patients in a hospital. It is assumed that LOS (in days) is a continuous random variable following the Weibull distribution with parameters $\square=2$ and $\square=4$ having the following $p d f$ :

$$
f(x)=\frac{2}{16} e^{-\frac{x^{2}}{16}} ; x>0
$$

1. Find the CDF function of $f(x)$ and then find the inverse transform for generating random numbers from $f(x)$.
$F(x) \int_{0}^{x} \frac{2}{16} e^{-\frac{x^{2}}{16}}=1-e^{-\frac{x^{2}}{16}}$
$\mathrm{F}^{-1}(\mathrm{u})=4(-\ln (1-\mathrm{u}))^{0.5}$
2. Compute the average and standard deviation of LOS, by simulating the length of stay for 50 patients using the following uniform ( 0,1 ) numbers (use as needed) and your answer in (1) to compute.

| $U(0,1)$ |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

4. Assume that LOS for any patient is at least $Y$ days. Where $Y$ is a random variable following the Exponential distribution with mean half a day. Find the new inverse transform for generating random numbers from $f(x)$. Then, compute the average and standard deviation of LOS, by simulating the length of stay for 50 patients using the uniform $(0,1)$ numbers in part (2) for $X$ and the uniform random numbers in part (3) for $Y$.
$\mathrm{Y} \sim \operatorname{Exp}(2)$
$Y=-0.5 \ln (1-u 2)$
$\mathrm{X} \sim$ Weibull $(2,4)$
$X=Y+4(-\ln (1-u))^{0.5}$

OR 441 - Modeling and Simulation

## Ouestion \#4:

Consider a continuous random variable with the following pdf:

$$
f(x)= \begin{cases}\frac{1}{2} & 0 \leq x \leq 1 \\ \frac{3}{4}-\frac{x}{4} & 1 \leq x \leq 3\end{cases}
$$

(a) Construct the algorithm for obtaining random numbers from $f(x)$ using the inverse transform method.

$$
\begin{aligned}
& \mathrm{F}(\mathrm{x})= \begin{cases}0 & x<0 \\
\int_{0}^{x} \frac{1}{2} d x=\frac{1}{2} x & 0 \leq x \leq 1 \\
\int_{0}^{1} x+\int_{1}^{x} \frac{3}{4}-\frac{x}{4} d x=1-\frac{(3-x)^{2}}{8} & 1 \leq x \leq 3\end{cases} \\
& \mathrm{F}^{-1}(\mathrm{u})= \begin{cases}2 u & x \geq 3 \\
3-\sqrt{8(1-u)} & 0 \leq u \leq 0.5\end{cases} \\
&
\end{aligned}
$$

(b) Using your answer in (a), give 10 random numbers from $\mathrm{f}(x)$ using the following uniform numbers.

|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| u | 0.387 | 0.336 | 0.466 | 0.074 | 0.184 | 0.34 | 0.9 | 0.875 | 0.475 | 0.64 |
| x | 0.774 | 0.672 | 0.932 | 0.148 | 0.368 | 0.672 | 2.106 | 2.000 | 0.950 | 1.294 |

(c) Assume that the variable X represents the time between arrival to a service station (in hours). The station work hours are from 8 am to 3 pm . The owner wants to determine the expected number arrivals per day using simulation output for 5 days. Using the following uniform numbers for each day, estimate the average number of arrivals per day.

|  | Day-1 |  | Day-2 |  | Day-3 |  | Day-4 |  | Day-5 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X | TBA | AT | TBA | AT | TBA | AT | TBA | AT | TBA | AT |
| 1 | 0.388 | 0.388 | 0.978 | 0.978 | 0.058 | 0.058 | 0.762 | 0.762 | 0.136 | 0.136 |
| 2 | 1.704 | 2.092 | 0.600 | 1.578 | 1.735 | 1.793 | 0.706 | 1.468 | 0.512 | 0.648 |
| 3 | 0.168 | 2.260 | 1.707 | 3.285 | 1.626 | 3.419 | 2.133 | 3.601 | 1.549 | 2.197 |
| 4 | 0.222 | 2.482 | 2.190 | 5.475 | 1.109 | 4.528 | 1.165 | 4.766 | 0.654 | 2.851 |

| Average | 5.4 |  |  |  |  |  |  |  |  |  |

## Ouestion \#5:

Consider a continuous random variable with the following pdf:

$$
f(x)= \begin{cases}\frac{x}{8}-\frac{1}{4} & 2 \leq x \leq 4 \\ \frac{10}{24}-\frac{x}{24} & 4 \leq x \leq 10\end{cases}
$$

(a) Construct the algorithm for obtaining random numbers from $\mathrm{f}(x)$ using the acceptancerejection method using majorizing function $g(x)=\max f(x)$.
$g(x)=\max f(x)=0.25$
$\mathrm{c}=\int_{2}^{10} 0.25=2$
$\mathrm{w}(\mathrm{x})=\frac{0.25}{2}=\frac{1}{8}$
$\mathrm{W}(\mathrm{x})=\int_{2}^{x} \frac{1}{8}=\frac{x-2}{8}$
$W^{-1}(\mathrm{x})=8 \mathrm{u}+2$
(b) Using your answer in (a), give 10 random numbers from $f(x)$ using the following uniform numbers (as needed).

|  | U | W | f(w) | g(w) | $\mathrm{f}(\mathrm{w}) / \mathrm{g}(\mathrm{w})$ | v | Acc/rej |
