

## Tutorial 1 Answer Sheet

1- Calculate the following:

- a. The weight in grams of 0.45 moles of glucose ( $C_6H_{12}O_6$ )  
No. of moles =  $wt_g / \text{MWT}$  thus,  $wt_g = \text{No. of moles} \times \text{MWT}$   
MWT of glucose =  $(12 \times 6) + (1 \times 12) + (16 \times 6) = 180 \text{g/mole}$   
 $wt_g = 0.45 \times 180 = 81 \text{ g}$

- b. The weight in grams of  $1 \times 10^{23}$  molecules of NaCl.

$$1 \text{ mole has } 6.023 \times 10^{23}$$

$$\begin{aligned} ? \text{ mole has } 1 \times 10^{23} \\ = 0.166 \text{ mole} \end{aligned}$$

$$\text{MWT of NaCl} = (1 \times 23) + (1 \times 35.5) = 58.5 \text{g/mole}$$

$$wt_g = 0.166 \times 58.5 = 9.71 \text{ g}$$

- c. The number of molecules in 2.25 g of glycine.

$$\text{MWT of glycine} = (2 \times 12) + (1 \times 14) + (2 \times 16) + (5 \times 1) = 75 \text{g/mole.}$$

$$1 \text{ mole has } 75 \text{g}$$

$$? \text{ mole has } 2.25$$

$$= 0.03 \text{ mole}$$

$$\text{Since } 1 \text{ mole has } 6.023 \times 10^{23}$$

$$0.03 \text{ mole has } ? \text{ molecules}$$

$$= 0.03 \times 6.023 \times 10^{23}$$

$$= 0.18 \times 10^{23}$$

2- Calculate the normality of the following solutions:

- a. 250 ml of HCl containing 18.25 g of HCl.

$$N = \text{No. of equivalents} / V_{(L)}$$

$$\text{No. of equivalents} = wt_g \text{ of solute} / \text{equivalents weight}$$

$$EW = \text{MWT of solute} / n$$

$$\text{MWT of HCl} = (1 \times 35.5) + (1 \times 1) = 36.5 \text{g/mole}$$

$$n = 1$$

$$EW = \text{MWT of solute} / n$$

$$= 36.5 / 1 = 36.5$$

$$\text{No. of equivalents} = wt_g \text{ of solute} / \text{equivalents weight}$$

$$= 18.25 / 36.5$$

$$= 0.5$$

$$\begin{aligned}
 N &= \text{No. of equivalents} / V_{(L)} \\
 &= 0.5 / 0.25 \\
 &= 2 \text{ normal}
 \end{aligned}$$

b. 49 g of  $\text{H}_2\text{SO}_4$  in 250 ml.

$$\begin{aligned}
 \text{MWT of } \text{H}_2\text{SO}_4 &= (2 \times 1) + (1 \times 32) + (4 \times 16) = 98 \text{g/mole} \\
 n &= 2
 \end{aligned}$$

$$\begin{aligned}
 \text{EW} &= \text{MWT of solute} / n \\
 &= 98 / 2 = 49
 \end{aligned}$$

$$\begin{aligned}
 \text{No. of equivalents} &= \text{wt}_g \text{ of solute} / \text{equivalents weight} \\
 &= 49 / 49 \\
 &= 1
 \end{aligned}$$

$$\begin{aligned}
 N &= \text{No. of equivalents} / V_{(L)} \\
 &= 1 / 0.25 \\
 &= 4 \text{ normal}
 \end{aligned}$$

3- 12.25 g of phosphoric acid was dissolved in water and the volume made up to 100 ml, calculate:

- The normality of the solution.
- The molarity of the solution.

$$N = M \times n$$

$$M = \text{No. of moles of solute} / V_{(L)}$$

$$\text{No. of moles} = \text{wt}_g / \text{MWT}$$

$$\text{MWT of } \text{H}_3\text{PO}_4 = (3 \times 1) + (1 \times 31) + (4 \times 16) = 98 \text{g/mole.}$$

$$\begin{aligned}
 \text{No. of moles} &= \text{wt}_g / \text{MWT} \\
 &= 12.25 / 98 \\
 &= 0.125 \text{ mole}
 \end{aligned}$$

$$\begin{aligned}
 M &= \text{No. of moles of solute} / V_{(L)} \\
 &= 0.125 / 0.1 \\
 &= 1.25 \text{ molar}
 \end{aligned}$$

$$n = 3$$

$$\begin{aligned}
 N &= M \times n \\
 &= 1.25 \times 3 \\
 &= 3.75 \text{ normal}
 \end{aligned}$$

4- 20 g of NaCl is dissolved in 200 ml water, what is its W/V%?

$$\begin{aligned}
 &20 \text{ g in } 200 \text{ ml} \\
 &\quad ? \quad \text{in } 100 \text{ ml}
 \end{aligned}$$

= 10g NaCl in 100 ml water so the W/V% is 10

- 5- Calculate the percent V/V% of ethanol in a solution prepared by diluting 30 ml of ethanol to 250ml.

V/V% = the volume in ml of a solute / 100 ml of solution

30 ml of ethanol in 250 ml

? -----> 100 ml

$$\begin{aligned} \text{V/V\%} &= (30 \times 100) / 250 \\ &= 12\% \end{aligned}$$

- 6- Calculate the number of grams of BaCl<sub>2</sub>.H<sub>2</sub>O that you would need to prepare 100 ml of a 0.2 M solution.

$$\begin{aligned} \text{Volume} &= 100/1000 \\ &= 0.1 \text{ L} \end{aligned}$$

M = no. of moles/Volume(L)

$$\begin{aligned} \text{No. of moles} &= M \times \text{Volume(L)} \\ &= 0.2 \times 0.1 \\ &= 0.02 \text{ moles} \end{aligned}$$

no. of moles = WT(g)/MWT

WT(g) = no. of moles × MWT

$$\begin{aligned} \text{MWT} &= 137.33 + (35.45 \times 2) + (1 \times 2) + 16 \\ &= 226.23 \text{ g/mol} \end{aligned}$$

$$\begin{aligned} \text{WT(g)} &= 0.02 \times 226.23 \\ &= 4.52 \text{ g} \end{aligned}$$

- 7- Calculate the molarity and osmolality of a 10 W/V % MgCl<sub>2</sub> solution.

10 g in 100 ml

= 10g NaCl in 100 ml water so the W/V% is 10

MWT MgCl<sub>2</sub> = (1×24) + (2×35.5) = 95g/mole

$$\begin{aligned} \text{No. of moles} &= \text{wt}_g / \text{MWT} \\ &= 10 / 95 = 0.1 \text{ mole} \end{aligned}$$

$$\begin{aligned} M &= \text{No. of moles of solute} / V_{(L)} \\ &= 0.1 / 0.1 \\ &= 1 \text{ molar} \end{aligned}$$

$$\begin{aligned} \text{Osmolarity} &= M \times n \\ n &= 3 \end{aligned}$$

$$N = 1 \times 3$$

$$= 3 \text{ Osmolarity}$$

8- How would you prepare 0.2 L of 0.3 MgCl<sub>2</sub> W/V% solution.

$$0.3 \text{ g in } 100 \text{ ml is } 0.3\% \text{ W/V\% but since } 200 \text{ ml is needed}$$

$$? \text{ g in } 200 \text{ ml}$$

$$= (0.3 \times 200) / 100$$

$$= 0.6 \text{ g of MgCl}_2$$

0.6 g of MgCl<sub>2</sub> is dissolved in a little volume of distilled water then the volume was made up to 200ml with distilled water

9- A solution was prepared by dissolving 8 g of solid ammonium sulfate (MWT = 132.14) in 39.52 ml of water. Express the concentration in terms of: g/L, M, N, W/V%, mg%, osmolarity.

$$\text{g/L}$$

$$8\text{g} \text{ -----} > 39.52 \text{ ml}$$

$$? \text{ -----} > 1000 \text{ ml}$$

$$? = (8 \times 1000)/39.52 = 202.4 \text{ g/l}$$

$$M = \text{no. of moles/volume}_{(L)}$$

$$\text{no. of moles} = \text{wt/MWT} = 8/132.14 = 0.0605 \text{ mole}$$

$$\text{volume}_{(L)} = 39.52 \text{ ml}/1000 = 0.03952 \text{ L}$$

$$M = 0.0605/0.03952$$

$$= 1.53 \text{ molar}$$

$$N = n \times M$$

$$= 1 \times 1.53$$

$$= 1.53 \text{ N}$$

$$\text{W/V\%} = \text{wt in g/ volume in } 100 \text{ ml of solution}$$

$$8\text{g} \text{ -----} > 39.52 \text{ ml}$$

$$? \text{ -----} > 100 \text{ ml}$$

$$? = (8 \times 100)/39.52 = 20.24 \%$$

$$\text{mg\%}$$

$$\text{from W/V\%} = 20.24\%$$

$$\text{mg\%} = 20.24 \times 1000$$

$$= 2024 \text{ mg\%}$$

$$\text{Osmolarity} = n \times M$$

$$= 2 \times 1.53$$

$$= 3.06 \text{ osmolar}$$

- 10- A solution contains 15 g of  $\text{CaCl}_2$  in a total volume of 190 ml. Express the concentration of this solution in terms of: g/L, M, W/V%, mg%, osmolarity.

$$\begin{aligned} &\text{g/L} \\ 15\text{g} &\text{-----} > 190 \text{ ml} \\ ? &\text{-----} > 1000 \text{ ml} \\ ? &= (15 \times 1000)/190 = 78.9 \text{ g/l} \end{aligned}$$

$$\begin{aligned} M &= \text{no. of moles}/\text{volume}_{(L)} \\ \text{no. of moles} &= \text{wt}/\text{MWT} = 15/(40 + (35 \times 5)) = 0.135 \text{ mole} \\ \text{volume}(L) &= 190 \text{ ml}/1000 = 0.19 \text{ L} \\ M &= 0.135/0.19 \\ &= 0.711 \text{ molar} \end{aligned}$$

$$\begin{aligned} \text{W/V}\% &= \text{wt in g}/ \text{volume in 100 ml of solution} \\ 78.9\text{g} &\text{-----} > 1000 \text{ ml} \\ ? &\text{-----} > 100 \text{ ml} \\ ? &= (78.9 \times 100)/1000 = 7.89 \% \end{aligned}$$

$$\begin{aligned} &\text{mg}\% \\ \text{from W/V}\% &= 7.89\% \\ \text{mg}\% &= 7.89 \times 1000 \\ &= 7890 \text{ mg}\% \end{aligned}$$

$$\begin{aligned} \text{Osmolarity} &= n \times M \\ &= 3 \times 0.711 \\ &= 2.134 \text{ osmolar} \end{aligned}$$

## Tutorial 2 Answer Sheet

- How many ml of 0.8 M acetic acid ( $\text{CH}_3\text{COOH}$ ) are needed to prepare 200ml of 0.4N acetic acid?

$$N = M \times n$$

$$\text{so } M = N / n$$

n of the acetic acid =1

$$M \text{ of the required solution} = 0.4 / 1 = 0.4 \text{ molar}$$

$$C_1 \times V_1 = C_2 \times V_2$$

$$0.8 \times V_1 = 0.4 \times 200$$

$$0.8 \times V_1 = 80$$

$$V_1 = 80 / 0.8$$

$$V_1 = 100 \text{ ml}$$

So 100 ml of the 0.8M solution is needed and make up the volume to 200ml with distilled water.

### OR YOU CAN USE THIS WAY

$$N = M \times n$$

so  $M = N/n$

n of the acetic acid =1

$$M \text{ of the required solution} = 0.4 / 1 = 0.4 \text{ molar}$$

$M = \text{No. of moles of solute} / \text{thus } V_{(L)} \text{ thus}$

$$\text{No. of moles of required solution} = M \times V$$

$$= 0.4 \times 0.2$$

$$= 0.08 \text{ moles needed}$$

From the molarity of the stock solution:

0.8 mole in 1000 ml solution

0.08 moles in ? ml solution

$$= (0.08 \times 1000) / 0.8$$

$$= 100 \text{ ml}$$

So 100 ml of the 0.8M solution is needed and make up the volume to 200ml with distilled water.

2. Describe the preparation of 2L of a 0.23M  $\text{H}_2\text{SO}_4$  solution starting from a stock solution of  $\text{H}_2\text{SO}_4$  92% W/W%, SG=1.84 g/ml?

$$\text{MW of } \text{H}_2\text{SO}_4 = (2 \times 1) + (1 \times 32) + (4 \times 16) = 98 \text{ g/mole.}$$

$$M = \text{No. of moles of solute} / V_{(L)}$$

$$\text{No. of moles} = M \times V_{(L)}$$

$$= 0.23 \times 2 = 0.46 \text{ mole}$$

$$\text{wt}_g = \text{No. of moles} \times \text{MWT}$$

$$= 0.46 \times 98 = 45.08 \text{ g}$$

Since 92g of  $\text{H}_2\text{SO}_4$  stock solution in 100g solution

45.08g of  $\text{H}_2\text{SO}_4$  required solution in ?g solution

$$= (45.08 \times 100) / 92$$

$$= 49 \text{ g of solution}$$

$$V = \text{wt} / \rho = 49 / 1.84$$

$$= 26.6 \text{ ml}$$

So 26.6 ml of the stock solution is taken then complete up the volume to 2 liters with distilled water.

3. Calculate the molarity of  $\text{H}_2\text{SO}_4$  which has a molality of 6.8 molal,  $P = 1.48 \text{ g/ml}$ ?

Molality means 6.8 mole of solute in 1000 g of solvent.

$$\text{MWT of } \text{H}_2\text{SO}_4 = (2 \times 1) + (1 \times 32) + (4 \times 16) = 98 \text{ g/mole.}$$

$$\text{No. of moles} = \text{wt}_g / \text{MWT}$$

$$\text{thus } \text{wt}_g = \text{No. of moles} \times \text{MWT}$$

$$= 6.8 \times 98$$

$$= 666.4 \text{ g}$$

The weight of solution = weight of solvent + weight of solute.

$$= 1000 + 666.4$$

$$= 1666.4 \text{ g}$$

$$V = \text{wt} / \rho$$

$$= 1666.4 / 1.48$$

$$= 1125.9 \text{ ml}$$

Since 6.8 mole of solute in 1125.9 ml of solution

? mole of solute in 1000 ml of solution

$$= 6.04 \text{ molar}$$

4. A solution of  $\text{H}_2\text{SO}_4$  is 4% W/W%, density is 1.84 g/ml. Calculate the molarity, normality and molality?

### Molarity

$$\text{MWT of } \text{H}_2\text{SO}_4 = (2 \times 1) + (1 \times 32) + (4 \times 16) = 98 \text{ g/mole.}$$

Since 4% W/W is 4 g  $\text{H}_2\text{SO}_4$  in 100g solution.

$$\text{No. of moles} = \text{wt}_g / \text{MWT}$$

$$= 4 / 98$$

$$= 0.04 \text{ mole}$$

$$V = \text{wt} / \rho$$

$$= 100 / 1.84$$

$$= 54.35 \text{ ml of solution}$$

So 0.04 mole in 54.35 ml solution

$$\begin{aligned}
 & \text{? Mole in 1000 ml of solution} \\
 & = (0.04 \times 1000) / 54.35 \\
 & = 0.74 \text{ molar}
 \end{aligned}$$

**Normality**

$$\begin{aligned}
 N & = M \times n \\
 n & = 2 \\
 N & = 0.74 \times 2 \\
 & = 1.48 \text{ normal}
 \end{aligned}$$

**Molality**

Since the weight of solution = weight of solvent + weight of solute.  
 Thus, the weight of solvent = weight of solution - weight of solute.  

$$= 100\text{g} - 4 \text{ g}$$

$$= 96\text{g}$$

0.04 mole of solute in 96 g of solvent

? mole of solute in 1000 g of solvent

$$\begin{aligned}
 \text{No. of moles of solute 1000 g of solvent} & = (0.04 \times 1000) / 96 \\
 & = 0.42 \text{ moles}
 \end{aligned}$$

The molality is 0.42

5. Describe how to prepare a 400 ml, 1:8 dilution of a disinfectant solution from a stock solution provided using water as your diluent.

Since  $DF = V_f / V_i$  thus  $V_i = V_f / DF$

DF is 8

$$\begin{aligned}
 V_i & = 400 / 8 \\
 & = 50 \text{ ml.}
 \end{aligned}$$

To prepare, we need 50ml of the stock solution and make up the volume to 400ml with water

6. You are provided with 3ml of a 100 mg/ml stock solution of ampicillin and requested to prepare dilute it a final concentration of 25mg/ml and final volume of 200µl. Calculate the volume of stock solution needed? Describe the preparation process.

$$C_1 \times V_1 = C_2 \times V_2$$

$$C_1 = 100 \text{ mg/ml}, C_2 = 25\text{mg/ml}, V_2 = 200\mu\text{l}, V_1 = ?$$

$$100 \times V_1 = 25 \times 200$$

$$V_1 = (25 \times 200) / 100$$

$$= 50\mu\text{l}$$

To prepare, we need 50 $\mu\text{l}$  of the stock solution and make up the volume to 200 $\mu\text{l}$  with water.

**NOTE: I did not convert volume!!**

7. A 100.0 mL of 2.500 M KBr solution is on hand. You need to prepare a 0.5500 M KBr. What is the final volume of solution that results?

$$C_1 \times V_1 = C_2 \times V_2$$

$$C_1 = 2.5 \text{ M}, C_2 = 0.55 \text{ M}, V_1 = 100\text{ml}, V_2 = ?$$

$$2.5 \times 100 = 0.55 \times V_2$$

$$V_2 = (2.5 \times 100) / 0.55$$

$$V_2 = 454.55\text{ml}.$$

The final volume of the solution is 454.55ml

8. From the following serial dilution answer the following (stock solution is 0.4M);

a- The dilution factor ?

b- Calculate the concentration of tube 4 and 7 in the serial dilution .

a- DF:

$$DF = V_f / V_i$$

$$= 10 / 1$$

$$DF = 10$$

b- Serial dilution:

$$\text{For tube 4} = 10 \times 10 \times 10 \times 10 = 10000. \text{ The concentration is } 0.4/10000$$

$$= 4 \times 10^{-5} \text{ M}$$

For tube 7 =  $10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 = 10000000$ . The concentration is  $0.4/10000000 = 4 \times 10^{-8}M$
