Create the classes along with the functionality given in the following UML Diagram. To understand the problem, please refer to the description given after the diagram.

Man	1 04	Woman
-name:String -age:int	marries	-name:String -age:int
+Man(name:String, age:int) +addWife(wife:Woman):Boolean +displayWivesInfo():void + divorce(w: Woman) +getYoungestWife():Woman +getWives (a: int):Woman[] +getName():String +getAge():int		+Woman(name:String, age:int) +setHusband(husband:Man) +getName():String +getAge():int +displayWomanInfo():void

Woman Class:

- o Attributes:
 - *name*: the name of the Woman.
 - age: age of the Woman
- o Methods:
 - Woman(name: string, age: int): constructor. Assigns given values to the attributes and assigns null to husband.
 - *setHusband*(*husband*:Man): sets the husband of the woman.
 - *displayWomanInfo()*: this method displays all the attributes of the Woman along with the name and age of Husband if woman is married.
 - *getters:* return the values of the corresponding attributes

Man Class:

o Attributes:

- *name*: the name of the Man.
- age: age of the Man

o Methods:

- *Man(name:String, age:int)* : constructor
- *addWife(wife:Woman):* this method associates a new wife to the man. It returns true if the *wife* is associated false otherwise.
- displayWivesInfo(): displays the detail(name and age) of every wife which is married to the man and in case if man is unmarried, it will display "Ohh..He is unmarried".
- divorce(w: Woman): this method removes the Woman w from the wives of the man
- *getYoungestWife():* returns the youngest wife of the man.
- *getWives(a: int):* this method returns an array containing all the wives of the man whose age is less than *a*.
- *getters:* return the values of the corresponding attributes

HINT: How to Solve Association

Man class will have an attribute array *arrwives* of type *Woman* along with a *counter* and *Woman* class will an attribute *husband* of type *Man*.
