CSC 113 – Computer Programming-II (3-2-1) - Required Course

Catalog description:

This course continues the coverage of the fundamental concepts of Object Oriented Programming started in Programming I (CSC 111). It covers more advanced concepts and topics such as relationships between classes, inheritance, polymorphism, abstract classes, error handling, interfaces, generics and data structures such as linked lists, stacks and queues, in addition to graphical user interface.

Prerequisite:

CSC111 Programming-I.

Prerequisite to:

CSC 212 Data Structures
CSC 261 Artificial Intelligence Programming Languages.

Co-requisite to:

Texts:

An Introduction to Object-Oriented Programming with Java, 4th edition, by C. Thomas Wu (Otani), McGraw-Hill Higher Education, Fifth Edition.

Course Objectives:

The objective of this course is to develop the students' ability to use the basics of object-oriented design and programming. The students learn the characteristic features of object orientation – classes, methods, polymorphism, and inheritance – through both the lectures and a sequence of illustrative programming assignments. Students will also study list data structures, event driven programming and graphical user interface tools.

Course Outcomes:

1. Upon completing CSC113, students should have the following capabilities:
2. Understand classes and instances, and how programs can be designed as a collection of communicating objects.
3. Understand and be able to design and implement programs using object oriented programming concepts like: encapsulation, inheritance, polymorphism, abstract classes and methods, and Interfaces.
4. Use standard documentation, such as UML class diagrams and online Java documentation.
5. Create and manipulate dynamic data structures, such as linked lists, stacks and queues.
6. Create and access files with Java.
7. Design and Implement event-driven interactive programs.
8. Students should learn how to work in groups towards achieving the same goal.
9. Learn how to compile programs on at least one platform using command lines and / or IDE.

Expected Performance Criteria:

Outcomes will be assessed using classroom and lab performance, graded homework assignments (lecture and lab), quizzes (lecture and lab), graded lab exercises, course project (lab), and midterm and final examinations (lecture and lab).

The student is expected to perform assigned programming tasks in Java and to pass three written examinations.

Topics:

1. Array of Objects
2. methods returning objects
3. Relationship between Classes using UML
4. Inheritance, polymorphism and Interface
5. Graphical User Interface
6. Exception handling
7. File Input/output (Binary, Text and Object files)
8. Data structures, Linked Lists, Stacks, Queues
9. Generics

Schedule:

14 weeks of three 50-minute lectures, one 50-minute tutorial, and two 50-minutes laboratory session per week.

Relationship of Course to ABET Criteria:

Criterion 2 - Program Educational Objectives:

This course allows the student to gain the necessary skill and experience to contribute to either a research or development project involving the design concepts of modern uni-processor computers

Criterion 3 - Program Outcomes:

- a. An ability to apply knowledge of computing and mathematics appropriate to the discipline; ✓
Students write object oriented and event driven programs.
- b. An ability to analyze a problem, and identify and define the computing requirements appropriate to its solution;

- c. An ability to design, implement and evaluate a computer-based system, process, component, or program to meet desired needs; ✓
Students are requested to design small systems and implement and test their solutions in HW and Lab assignments.
- d. An ability to function effectively on teams to accomplish a common goal;
Students work by groups of two or more to accomplish one or more mini-projects during the course ✓
- e. An understanding of professional, ethical, legal, security, and social issues and responsibilities;

- f. An ability to communicate effectively with a range of audiences;
- g. An ability to analyze the local and global impact of computing on individuals, organizations and society;

- h. Recognition of the need for, and an ability to engage in, continuing professional development;

- i. An ability to use current techniques, skills, and tools necessary for computing practices. ✓
The students learn the current dominant paradigm, object-oriented design and programming and learn how to use Integrated Development Environment and/or compile programs using command lines.
- j. An ability to apply mathematical foundations, algorithmic principles, and computer science theory in the modeling and design of computer-based systems in a way that demonstrates comprehension of the tradeoffs involved in design choices;

Criterion 4 – Professional Component:

This course provides the students with basic design and programming skills that will be used (and further developed) throughout the curriculum.
