Two-Factor Analysis of Variance
14.1 An experiment was conducted to study the effects of temperature and type of oven on the life of a particular component. Four types of ovens and 3 temperature levels were used in the experiment. Twenty-four pieces were assigned randomly, two to each combination of treatments, and the following results recorded.

|  | Oven |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Temperature $\left({ }^{\circ} \boldsymbol{F}\right)$ | $\boldsymbol{O}_{\mathbf{1}}$ | $\boldsymbol{O}_{\mathbf{2}}$ | $\boldsymbol{O}_{\mathbf{3}}$ | $\boldsymbol{O}_{\mathbf{4}}$ |
| $\mathbf{5 0 0}$ | 227 | 214 | 225 | 260 |
|  | 221 | 259 | 236 | 229 |
| $\mathbf{5 5 0}$ | 187 | 181 | 232 | 246 |
|  | 208 | 179 | 198 | 273 |
| $\mathbf{6 0 0}$ | 174 | 198 | 178 | 206 |
|  | 202 | 194 | 213 | 219 |

Using a 0.05 level of significance, test the hypothesis that:
(a) different temperatures have no effect on the life of the component;
(b) different ovens have no effect on the life of the component;
(c) the type of oven and temperature do not interact.

\[

\]

c)

1. $\boldsymbol{H}_{\mathbf{0}}$ : There is no interaction bettween the diffferent tempreatures and the different types of ovens.
$\boldsymbol{H}_{1}$ :There is interaction bettween the diffferent tempreatures
and the different types of ovens.
2. Test Statistic :

$$
\begin{aligned}
& \quad S S A B=n \sum_{i=1}^{a} \sum_{j=1}^{b}\left(\bar{y}_{i j .}-\bar{y}_{i . .}-\bar{y}_{. j .}+\bar{y}_{\ldots . .}\right)^{2} \\
& \quad=2\left[(224-233.875-203.1667+)^{2}+\cdots\right. \\
& \left.\quad+(212.5-198-238.833+214.958)^{2}\right]=3126 \\
& M S A B=\frac{3126}{6}=521
\end{aligned}
$$

$S S E=\sum_{i=1}^{a} \sum_{j=1}^{b} \sum_{k=1}^{n}\left(y_{i j k}-\bar{y}_{i j}\right)^{2}=(227-224)^{2}+\cdots+(219-212.5)^{2}=3833$
$M S E=\frac{S S E}{a b(n-1)}=\frac{3833}{12}=319.5$
$F_{3}=\frac{M S A B}{M S E}=\frac{521}{319.5}=1.63$
4.Decision:
$F_{3}=1.63 \ngtr 2.996=f_{0.05,6,12}$
We cannot reject $\boldsymbol{H}_{\mathbf{0}}$ i.e ther is no interaction.
a) 1. $\boldsymbol{H}_{\mathbf{0}}$ :There is no difference in the mean of the comonent life of the 3 tempreatures.
$\boldsymbol{H}_{\mathbf{1}}$ : At least one mean different.
2.Test Statistic:

$$
\begin{gathered}
S S A=b n \sum_{i=1}^{a}\left(\bar{y}_{i . .}-\bar{y}_{\ldots . .}\right)^{2} \\
=8\left[(233.875-214.958)^{2}+\cdots+(198-214.958)^{2}\right]=5194 . \\
M S A=\frac{519}{2}=2597 \\
F=\frac{M S A}{M S E}=\frac{2597}{312.5}=8.128
\end{gathered}
$$

3.Desision:

Since $F=8.128>3.9=f_{0.05,2,12}$ we reject $\boldsymbol{H}_{\mathbf{0}}$.
There is a significant difference in the mean of component life of the 3 temperatures.
b) 1. $\boldsymbol{H}_{\mathbf{0}}$ : There is no difference in the mean of the comonent life of the 3 tempreatures.
$\boldsymbol{H}_{\mathbf{1}}$ : At least one mean different.
2.Test Statistic:

$$
\begin{gathered}
\text { SSB }=\operatorname{an} \sum_{i=1}^{b}\left(\bar{y}_{. j .}-\bar{y}_{\ldots .}\right)^{2} \\
=(203.1667-214.958)^{2}+\cdots+(238.833-214.958)^{2}=4963
\end{gathered}
$$

$$
M S B=\frac{M S B}{M S E}=\frac{1654.4}{319.5}=5.18
$$

3.Decision:

Since $F=5.18>3.49=f_{0.05,3,12}$ we reject $\boldsymbol{H}_{\mathbf{0}}$.
There is a significant difference in the mean of component life of the 4 ovens types.
H.W 14.3 Three strains of rats were studied under 2 environmental conditions for their performance in a maze test. The error scores for the 48 rats were recorded.

| Environment | Strain |  |  |
| :---: | :---: | :---: | :---: |
|  | Bright | Mixed | Dull |
| Free | 2812 | 3383 | 10194 |
|  | 2223 | 3614 | 3356 |
|  | 2510 | 4176 | 12283 |
|  | 3686 | $22 \quad 58$ | $35 \quad 23$ |
| Restricted | 7232 | $60 \quad 89$ | 136120 |
|  | 4893 | 35126 | $\begin{array}{ll}38 & 153\end{array}$ |
|  | 2531 | 83110 | 64128 |
|  | 9119 | 99118 | 87140 |

Use a 0.01 level of significance to test the hypothesis that:
(a) there is no difference in error scores for different environments;
(b) there is no difference in error scores for different strains;
(c) the environments and strains of rats do not interact.
c) 1. $\boldsymbol{H}_{\mathbf{0}}$ :There is no interaction bettween the diffferent environments and diffferent strains of rats.
$\boldsymbol{H}_{\mathbf{1}}$ : There is interaction bettween the diffferent the diffferent environments and diffferent strains of rats.
2.Test Statistic:

$$
M S A B=617.6, \quad M S E=1004.6, \quad F_{3}=0.61
$$

3.Decision:
$F_{3}=0.61 \ngtr f_{0.01,2,42}$
We cannot reject $\boldsymbol{H}_{\mathbf{0}}$ i.e ther is no interaction.
a) 1. $\boldsymbol{H}_{\mathbf{0}}$ :There is no difference in the mean of error scores
for different environments
$\boldsymbol{H}_{1}$ : At least one mean different.
2.Test Statistic:

$$
\begin{gathered}
S S A=b n \sum_{i=1}^{a}\left(\bar{y}_{i . .}-\bar{y}_{\ldots . .}\right)^{2} \\
M S A=14875.5
\end{gathered}
$$

$$
F=\frac{M S A}{M S E}=14.81
$$

3.Desision:

Since $F=14.81>f_{0.01,1,42}$ we reject $\boldsymbol{H}_{\mathbf{0}}$.
There is a significant difference in the error scores mean for different environments.
b) $1 . \boldsymbol{H}_{\mathbf{0}}$ : There is no difference in the mean of error scores for different strains of rats.
$\boldsymbol{H}_{\mathbf{1}}$ : At least one mean different.
2.Test Statistic:

$$
\begin{gathered}
S S B=a n \sum_{i=1}^{b}\left(\bar{y}_{. j .}-\bar{y}_{\ldots . .}\right)^{2} \\
M S B=\frac{M S B}{M S E}=9077.1 \\
F_{2}=9.04
\end{gathered}
$$

3.Decision:

Since $F_{2}=9.04>f_{0.01,2,42}$ we reject $\boldsymbol{H}_{\mathbf{0}}$.
Thus, there is a significant difference in the error scores mean for different strains of rats.

## Chapter 9

16.1 The following data represent the time, in minutes, that a patient has to wait during 12 visits to a doctor's office before being seen by the doctor:

171520203228122625253524
Use the sign test at the 0.05 level of significance to test the doctor's claim that the median waiting time for her patients is not more than 20 minutes.

$$
n=12, \alpha=0.05
$$

1. $H_{0}: \tilde{\mu}=20$ vs $H_{1}: \tilde{\mu}>20$
2.Calculat x \& p-value.

| 17 | 15 | 20 | 20 | 32 | 28 | 12 | 26 | 25 | 25 | 35 | 24 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| - | - | . | . | + | + | - | + | + | + | + | + |

Thus, $x=7$

$$
p-\text { value }=p\left(X \geq 7, p=\frac{1}{2}\right)=\sum_{x=7}^{10}\binom{10}{x}\left(\frac{1}{2}\right)^{x}\left(\frac{1}{2}\right)^{10-x}=\left(\frac{1}{2}\right)^{10} \sum_{x=7}^{10}\binom{10}{x}=0.1719
$$

## 3.DECISION:

Since $P$-value $=0.1719>0.05=\alpha$
We cannot reject $H_{0}$. i.e the median is not greater than 20 .
16.8 Analyze the data of Exercise 16.1 by using the signed-rank test.

$$
n=12, \alpha=0.05
$$

1. $H_{0}: \tilde{\mu}=20$ vs $H_{1}: \tilde{\mu}>20$
2.Calculat w_

| time | 17 | 15 | 20 | 20 | 32 | 28 | 12 | 26 | 25 | 25 | 35 | 24 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| di-d0 | -3 | -5 | 0 | 0 | 12 | 8 | -8 | 6 | 5 | 5 | 15 | 4 |
| Rank | 1 | 4 | - | - | 9 | 7.5 | 7.5 | 6 | 4 | 4 | 10 | 2 |

$$
W_{-}=1+4+7.5=12.5 ; \quad W_{+}=9+7.5+6+4+4+10+2=42.5
$$

3.Decision:

Since $W_{-}=12.5>11=W_{10,0.05}$ we cannot reject $H_{0}$. "as in EX 16.1"
16.5 It is claimed that a new diet will reduce a person's weight by 4.5 kilograms, on average, in a period of 2 weeks. The weights of 10 women were recorded before and after a 2-week period during which they followed this diet, yielding the following data:

| Woman | Weight <br> Before | Weight <br> After |
| :--- | :--- | :--- |
| 1 | 58.5 | 60.0 |
| 2 | 60.3 | 54.9 |
| 3 | 61.7 | 58.1 |
| 4 | 69.0 | 62.1 |
| 5 | 64.0 | 58.5 |
| 6 | 62.6 | 59.9 |
| 7 | 56.7 | 54.4 |
| 8 | 63.6 | 60.2 |
| 9 | 68.2 | 62.3 |
| 10 | 59.4 | 58.7 |

Use the sign test at the 0.05 level of significance to test the hypothesis that the diet reduces the median weight by 4.5 kilograms against the alternative hypothesis that the median weight loss is less than 4.5 kilograms.

$$
n=10, \alpha=0.05
$$

1. $H_{0}: \tilde{\mu}_{1}-\tilde{\mu}_{2}=4.5$ vs $H_{1}: \tilde{\mu}_{1}-\tilde{\mu}_{2}<4.5$
2.Calculat x \& p-value.

| Woman | Weight <br> Before | Weight <br> After | di | di-d0 | sign |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 58.5 | 60.0 | -1.5 | -6 | - |
| 2 | 60.3 | 54.9 | 5.4 | 0.9 | + |
| 3 | 61.7 | 58.1 | 3.6 | -0.9 | - |
| 4 | 69.0 | 62.1 | 6.9 | 2.4 | + |
| 5 | 64.0 | 58.5 | 5.5 | 1 | + |
| 6 | 62.6 | 59.9 | 2.7 | -1.8 | - |
| 7 | 56.7 | 54.4 | 2.3 | -2.2 | - |
| 8 | 63.6 | 60.2 | 3.4 | -1.1 | - |
| 9 | 68.2 | 62.3 | 5.9 | 1.4 | + |
| 10 | 59.4 | 58.7 | 0.7 | -3.8 | - |

Thus, $x=4$

$$
p-\text { value }=p\left(X \leq 4, p=\frac{1}{2}\right)=\sum_{x=0}^{4}\binom{10}{x}\left(\frac{1}{2}\right)^{x}\left(\frac{1}{2}\right)^{10-x}=\left(\frac{1}{2}\right)^{10} \sum_{x=0}^{4}\binom{10}{x}=0.377
$$

## 3.DECISION:

Since P-value $=0.377>0.05=\alpha$ we cannot reject $H_{0}$. i.e the diet reduces median weight by 4.5 .
16.10 The weights of $\mathbf{5}$ people before they stopped smoking and $\mathbf{5}$ weeks after they stopped smoking, in kilograms, are as follows:

|  | Individual |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| Before | 66 | 80 | 69 | 52 | 75 |
| After | 71 | 82 | 68 | 56 | 73 |

Use the signed-rank test for paired observations to test the hypothesis, at the 0.05 level of significance, that giving up smoking has no effect on a person's weight against the alternative that one's weight increases if he or she quits smoking.

$$
n=5, \alpha=0.05
$$

1. $H_{0}: \tilde{\mu}_{1}-\tilde{\mu}_{2}=0$ vs $H_{1}: \tilde{\mu}_{1}-\tilde{\mu}_{2}<0$
2.Test statistic

| Woman | Weight <br> Before | Weight <br> After | di | di-d0 | Ranks |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 66 | 71 | -5 | -5 | 5 |
| 2 | 80 | 82 | -2 | -2 | 2.5 |
| 3 | 69 | 68 | 1 | 1 | 1 |
| 4 | 52 | 56 | -4 | -4 | 4 |
| 5 | 75 | 73 | 2 | 2 | 2.5 |

$$
W_{+}=1+2.5=3.5
$$

3.Decision:

Since $W_{+}=3.5>1=W_{5,0.05}$
We cannot reject $H_{0}$, i.e quitting smoking doesn't effect on a person's weight.
16.12 The following are the numbers of prescriptions filled by two pharmacies over a 20 day period:

| Day | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Pharmacy A | 19 | 21 | 15 | 17 | 24 | 12 | 19 | 14 | 20 | 18 | 23 | 21 | 17 | 12 | 16 | 15 | 20 | 18 | 14 | 22 |
| Pharmacy B | 17 | 15 | 12 | 12 | 16 | 15 | 11 | 13 | 14 | 21 | 19 | 15 | 11 | 10 | 20 | 12 | 13 | 17 | 16 | 18 |

Use the signed-rank test at the $\mathbf{0 . 0 1}$ level of significance to determine whether the two pharmacies, on average, fill the same number of prescriptions against the alternative that pharmacy $A$ fills more prescriptions than pharmacy $B$.

$$
n=20, \alpha=0.01
$$

1. $H_{0}: \tilde{\mu}_{1}-\tilde{\mu}_{2}=0$ vs $H_{1}: \tilde{\mu}_{1}-\tilde{\mu}_{2}>0$
2. Test statistic

| Day | A | B | di | Rank |  |
| ---: | ---: | ---: | ---: | ---: | ---: |
| 1 | 19 | 17 | $\mathbf{2}$ | 3 | 4 |
| 2 | 21 | 15 | $\mathbf{6}$ | 14 | $\mathbf{1 5 . 5}$ |
| 3 | 15 | 12 | $\mathbf{3}$ | 6 | 7.5 |
| 4 | 17 | 12 | $\mathbf{5}$ | 13 | 13 |
| 5 | 24 | 16 | $\mathbf{8}$ | 20 | $\mathbf{1 9 . 5}$ |
| 6 | 12 | 15 | $\mathbf{- 3}$ | 7 | 7.5 |
| 7 | 19 | 11 | $\mathbf{8}$ | 19 | $\mathbf{1 9 . 5}$ |
| 8 | 14 | 13 | $\mathbf{1}$ | 2 | $\mathbf{1 . 5}$ |
| 9 | 20 | 14 | $\mathbf{6}$ | 15 | $\mathbf{1 5 . 5}$ |
| 10 | 18 | 21 | $\mathbf{- 3}$ | 8 | 7.5 |
| 11 | 23 | 19 | $\mathbf{4}$ | 12 | $\mathbf{1 1}$ |
| 12 | 21 | 15 | $\mathbf{6}$ | 16 | $\mathbf{1 5 . 5}$ |
| 13 | 17 | 11 | $\mathbf{6}$ | 17 | 15.5 |
| 14 | 12 | 10 | $\mathbf{2}$ | 4 | 4 |
| 15 | 16 | 20 | $\mathbf{- 4}$ | 11 | $\mathbf{1 1}$ |
| 16 | 15 | 12 | $\mathbf{3}$ | 9 | 7.5 |
| 17 | 20 | 13 | $\mathbf{7}$ | 18 | 18 |
| 18 | 18 | 17 | $\mathbf{1}$ | 1 | $\mathbf{1}$ |
| 19 | 14 | 16 | $\mathbf{- 2}$ | 5 | 4 |
| 20 | 22 | 18 | $\mathbf{4}$ | 10 | $\mathbf{1 1}$ |

$$
W_{-}=7.5+7.5+11+4=30
$$

3.Decision:

Since $W_{-}=30<43=W_{5,0.01}$
We reject $H_{0}$, i.e the two pharmacies fill the same numbers of prescriptions.
16.32 The following table gives the recorded grades for 10 students on a midterm test and the final examination in a calculus course:

| Student | Midterm Test | Final Examination |
| :--- | :--- | :--- |
| 1 | 84 | 73 |
| 2 | 98 | 63 |
| 3 | 91 | 87 |
| 4 | 72 | 66 |
| 5 | 86 | 78 |
| 6 | 93 | 78 |
| 7 | 80 | 91 |
| 8 | 0 | 0 |
| 9 | 92 | 88 |
| 10 | 87 | 77 |

(a) Calculate the rank correlation coefficient.

$$
\text { (a) } r_{s}=1-\frac{6 \sum d_{i}^{2}}{n\left(n^{2}-1\right)}
$$

| Student | Midterm <br> Test | Rank1 | Final <br> Examination | Rank2 | di=R1-R2 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 84 | 4 | 73 | 4 | 0 |
| 2 | 98 | 10 | 63 | 2 | 8 |
| 3 | 91 | 7 | 87 | 8 | -1 |
| 4 | 72 | 2 | 66 | 3 | -1 |
| 5 | 86 | 5 | 78 | 6.5 | -1.5 |
| 6 | 93 | 9 | 78 | 6.5 | 2.5 |
| 7 | 80 | 3 | 91 | 10 | 7 |
| 8 | 0 | 1 | 0 | 1 | 0 |
| 9 | 92 | 8 | 88 | 9 | -1 |
| 10 | 87 | 6 | 77 | 5 | 1 |

Thus, $\sum d_{i}^{2}=125.5$

$$
r_{s}=1-\frac{6(125.5)}{10(99)}=0.239
$$

16.37 Two judges at a college homecoming parade rank eight floats in the following order:

| Float |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Judge A | 5 | 8 | 4 | 3 | 6 | 2 | 7 | 1 |
| Judge B | 7 | 5 | 4 | 2 | 8 | 1 | 6 | 3 |

(a) Calculate the rank correlation coefficient.

| Float |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Judge A | 5 | 8 | 4 | 3 | 6 | 2 | 7 | 1 |
| Judge B | 7 | 5 | 4 | 2 | 8 | 1 | 6 | 3 |
| di | -2 | 3 | 0 | 1 | 2 | 1 | 1 | -2 |

$$
r_{s}=1-\frac{6 \sum d_{i}^{2}}{n\left(n^{2}-1\right)}
$$

Thus, $\sum d_{i}^{2}=24$

$$
r_{s}=1-\frac{6(24)}{10(63)}=0.7143
$$
