MARK (A) IF THE SENTENCE IS TRUE OR (B) IF IT IS FALSE.

1. Poisoning by organophosphates may lead to nausea, vomiting, excess salivation, loss of bowel movement control, urinary frequency and lack of urination control.

2. Organophosphates are short-acting cholinesterase inhibitors. They bind acetylcholinesterase reversibly.

3. Irritant poisons are substances that rapidly destroy tissue at the point of contact.

4. Gastric lavage with tap water is an important measure for treatment of sulphuric acid poisoning.
