Create class StudentSet including the following:

- `arStudentId`: array of double that represent student Id numbers. Can hold 100 elements.
- `arStudentName`: array of String that represent student names. Can hold 100 elements.
- No-argument constructor initializes `arStudentId` and `arStudentName` with the default values 0 and “NONAME”.
- Constructor
  ```
  StudentSet(double[] studentIds, String[] studentNames)
  ```
  that copies in `arStudentId` and `arStudentName` the content of the arrays given as parameters. We suppose the size of `studentIds` and `studentNames` < 100.
- Method `getStudentName(double id)` that looks for the existence of a given student Id and returns his name.
- Method `addStudent(double id, String name)` that adds a student’s data at the end of the arrays.
- Method `deleteStudent(double id)` that deletes the given Id number and the corresponding name. Deletion will consist in setting to default values.
