Chapter 5

The Network Layer
Network Layer Design Issues

- Store-and-Forward Packet Switching
- Services Provided to the Transport Layer
- Implementation of Connectionless Service
- Implementation of Connection-Oriented Service
- Comparison of Virtual-Circuit and Datagram Subnets
Store-and-Forward Packet Switching

The environment of the network layer protocols.
Implementation of Connectionless Service

Routing within a diagram subnet.
Implementation of Connection-Oriented Service

Routing within a virtual-circuit subnet.
# Comparison of Virtual-Circuit and Datagram Subnets

<table>
<thead>
<tr>
<th>Issue</th>
<th>Datagram subnet</th>
<th>Virtual-circuit subnet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circuit setup</td>
<td>Not needed</td>
<td>Required</td>
</tr>
<tr>
<td>Addressing</td>
<td>Each packet contains the full source and destination address</td>
<td>Each packet contains a short VC number</td>
</tr>
<tr>
<td>State information</td>
<td>Routers do not hold state information about connections</td>
<td>Each VC requires router table space per connection</td>
</tr>
<tr>
<td>Routing</td>
<td>Each packet is routed independently</td>
<td>Route chosen when VC is set up; all packets follow it</td>
</tr>
<tr>
<td>Effect of router failures</td>
<td>None, except for packets lost during the crash</td>
<td>All VCs that passed through the failed router are terminated</td>
</tr>
<tr>
<td>Quality of service</td>

Routing Algorithms

- The Optimality Principle
- Shortest Path Routing
- Flooding
- Distance Vector Routing
- Link State Routing
- Hierarchical Routing
- Broadcast Routing
- Multicast Routing
- Routing for Mobile Hosts
- Routing in Ad Hoc Networks
Routing Algorithms (2)

Conflict between fairness and optimality.
The Optimality Principle

(a) A subnet. (b) A sink tree for router B.
Shortest Path Routing

The first 5 steps used in computing the shortest path from A to D.
The arrows indicate the working node.
Flooding

Dijkstra's algorithm to compute the shortest path through a graph.

```c
#define MAX_NODES 1024  /* maximum number of nodes */
#define INFINITY 1000000000  /* a number larger than every maximum path */
int n, dist[MAX_NODES][MAX_NODES];  /* dist[i][j] is the distance from i to j */

void shortest_path(int s, int t, int path[]) {
    struct state {
        int predecessor;  /* previous node */
        int length;  /* length from source to this node */
        enum {permanent, tentative} label;  /* label state */
    } state[MAX_NODES];

    int i, k, min;
    struct state *p;

    for (p = &state[0]; p < &state[n]; p++) {  /* initialize state */
        p->predecessor = -1;
        p->length = INFINITY;
        p->label = tentative;
    }

    state[t].length = 0;  state[t].label = permanent;
    k = t;  /* k is the initial working node */
```
Flooding (2)

```c
do 
  /* Is there a better path from k? */
  for (i = 0; i < n; i++)           /* this graph has n nodes */
    if (dist[k][i] != 0 && state[i].label == tentative) {
      if (state[k].length + dist[k][i] < state[i].length) {
        state[i].predecessor = k;
        state[i].length = state[k].length + dist[k][i];
      }
    }

  /* Find the tentatively labeled node with the smallest label. */
  k = 0; min = INFINITY;
  for (i = 0; i < n; i++)
    if (state[i].label == tentative && state[i].length < min) {
      min = state[i].length;
      k = i;
    }
  state[k].label = permanent;
} while (k != s);

/* Copy the path into the output array. */
i = 0; k = s;
do {path[i++] = k; k = state[k].predecessor;} while (k >= 0);
```

Dijkstra's algorithm to compute the shortest path through a graph.
Distance Vector Routing

(a) A subnet. (b) Input from A, I, H, K, and the new routing table for J.
Distance Vector Routing (2)

The count-to-infinity problem.
Link State Routing

Each router must do the following:

1. Discover its neighbors, learn their network address.
2. Measure the delay or cost to each of its neighbors.
3. Construct a packet telling all it has just learned.
4. Send this packet to all other routers.
5. Compute the shortest path to every other router.
Learning about the Neighbors

(a) Nine routers and a LAN. (b) A graph model of (a).
Measuring Line Cost

A subnet in which the East and West parts are connected by two lines.

CEN 445 - Chapter 5
Building Link State Packets

(a) A subnet. (b) The link state packets for this subnet.
Distributing the Link State Packets

<table>
<thead>
<tr>
<th>Source</th>
<th>Seq.</th>
<th>Age</th>
<th>Send flags A C F</th>
<th>ACK flags A C F</th>
<th>Data</th>
</tr>
</thead>
<tbody>

<td>59</td>
<td>1 0 0</td>
<td>0 1 1</td>
<td></td>
</tr>
</tbody>
</table>

The packet buffer for router B in the previous slide (Fig. 5-13).
Hierarchical Routing

(a)

(b)

(c)

Hierarchical routing.
Reverse path forwarding. (a) A subnet. (b) a Sink tree. (c) The tree built by reverse path forwarding.
(a) A network.  (b) A spanning tree for the leftmost router.
(c) A multicast tree for group 1.  (d) A multicast tree for group 2.
Routing for Mobile Hosts

A WAN to which LANs, MANs, and wireless cells are attached.
Routing for Mobile Hosts (2)

Packet routing for mobile users.

1. Packet is sent to the mobile host’s home address
2. Packet is tunneled to the foreign agent
3. Sender is given foreign agent’s address
4. Subsequent packets are tunneled to the foreign agent
Routing in Ad Hoc Networks

Possibilities when the routers are mobile:

1. Military vehicles on battlefield.
   - No infrastructure.

2. A fleet of ships at sea.
   - All moving all the time

3. Emergency works at earthquake.
   - The infrastructure destroyed.

4. A gathering of people with notebook computers.
   - In an area lacking 802.11.
Route Discovery

(a) Range of A's broadcast.

(b) After B and D have received A's broadcast.

(c) After C, F, and G have received A's broadcast.

(d) After E, H, and I have received A's broadcast.

Shaded nodes are new recipients. Arrows show possible reverse routes.
Route Discovery (2)

<table>
<thead>
<tr>
<th>Source address</th>
<th>Request ID</th>
<th>Destination address</th>
<th>Source sequence #</th>
<th>Dest. sequence #</th>
<th>Hop count</th>
</tr>
</thead>
</table>

Format of a ROUTE REQUEST packet.
Route Discovery (3)

<table>
<thead>
<tr>
<th>Source address</th>
<th>Destination address</th>
<th>Destination sequence #</th>
<th>Hop count</th>
<th>Lifetime</th>
</tr>
</thead>
</table>

Format of a ROUTE REPLY packet.
Route Maintenance

(a) D's routing table before G goes down.

(b) The graph after G has gone down.
Node Lookup in Peer-to-Peer Networks

(a) A set of 32 node identifiers arranged in a circle. The shaded ones correspond to actual machines. The arcs show the fingers from nodes 1, 4, and 12. The labels on the arcs are the table indices.

(b) Examples of the finger tables.
Congestion Control Algorithms

- General Principles of Congestion Control
- Congestion Prevention Policies
- Congestion Control in Virtual-Circuit Subnets
- Congestion Control in Datagram Subnets
- Load Shedding
- Jitter Control
When too much traffic is offered, congestion sets in and performance degrades sharply.
General Principles of Congestion Control

1. Monitor the system.
   – detect when and where congestion occurs.

2. Pass information to where action can be taken.

3. Adjust system operation to correct the problem.
### Congestion Prevention Policies

<table>
<thead>
<tr>
<th>Layer</th>
<th>Policies</th>
</tr>
</thead>
</table>
| Transport   | • Retransmission policy  
               • Out-of-order caching policy  
               • Acknowledgement policy  
               • Flow control policy  
               • Timeout determination |
| Network     | • Virtual circuits versus datagram inside the subnet  
               • Packet queueing and service policy  
               • Packet discard policy  
               • Routing algorithm  
               • Packet lifetime management |
| Data link   | • Retransmission policy  
               • Out-of-order caching policy  
               • Acknowledgement policy  
               • Flow control policy |

Policies that affect congestion.
Congestion Control in Virtual-Circuit Subnets

(a) A congested subnet. (b) A redrawn subnet, eliminates congestion and a virtual circuit from A to B.
Hop-by-Hop Choke Packets

(a) A choke packet that affects only the source.

(b) A choke packet that affects each hop it passes through.
Jitter Control

(a) High jitter. (b) Low jitter.
Quality of Service

- Requirements
- Techniques for Achieving Good Quality of Service
- Integrated Services
- Differentiated Services
- Label Switching and MPLS
# Requirements

<table>
<thead>

How stringent the quality-of-service requirements are.
Buffering

Smoothing the output stream by buffering packets.
(a) A leaky bucket with water.  (b) a leaky bucket with packets.
The Leaky Bucket Algorithm

(a) Input to a leaky bucket. (b) Output from a leaky bucket. Output from a token bucket with capacities of (c) 250 KB, (d) 500 KB, (e) 750 KB, (f) Output from a 500KB token bucket feeding a 10-MB/sec leaky bucket.
The Token Bucket Algorithm

(a) Before.       (b) After.

Host computer

One token is added to the bucket every \( \Delta T \)

The bucket holds tokens

Networks

Host computer

Networks
### Admission Control

An example of flow specification.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Unit</th>

</tbody>
</table>
Packet Scheduling

(a) A router with five packets queued for line O.
(b) Finishing times for the five packets.
RSVP-The ReSerVation Protocol

(a) A network,  
(b) The multicast spanning tree for host 1.  
(c) The multicast spanning tree for host 2.
RSVP—The ReSerVation Protocol (2)

(a) Host 3 requests a channel to host 1. (b) Host 3 then requests a second channel, to host 2. (c) Host 5 requests a channel to host 1.
Expedited Forwarding

Expedited packets experience a traffic-free network.
Assured Forwarding

A possible implementation of the data flow for assured forwarding.

CEN 445 - Chapter 5
Label Switching and MPLS

Transmitting a TCP segment using IP, MPLS, and PPP.
Internetworking

• How Networks Differ
• How Networks Can Be Connected
• Concatenated Virtual Circuits
• Connectionless Internetworking
• Tunneling
• Internetwork Routing
• Fragmentation
Connecting Networks

A collection of interconnected networks.
# How Networks Differ

<table>
<thead>

<tr>
<td>Accounting</td>
<td>By connect time, by packet, by byte, or not at all</td>
</tr>
</tbody>
</table>

Some of the many ways networks can differ.
How Networks Can Be Connected

(a) Two Ethernets connected by a switch.
(b) Two Ethernets connected by routers.
Concatenated Virtual Circuits

Internetworking using concatenated virtual circuits.
Connectionless Internetworking

A connectionless internet.
Tunneling

Tunneling a packet from Paris to London.

CEN 445 - Chapter 5
Tunneling (2)

Tunneling a car from France to England.
Internetwork Routing

(a) An internetwork.  (b) A graph of the internetwork.
Fragmentation

(a) Transparent fragmentation.  (b) Nontransparent fragmentation.

(a) Transparent fragmentation.  (b) Nontransparent fragmentation.
Fragmentation (2)

Fragmentation when the elementary data size is 1 byte.
(a) Original packet, containing 10 data bytes.
(b) Fragments after passing through a network with maximum packet size of 8 payload bytes plus header.
(c) Fragments after passing through a size 5 gateway.
The Network Layer in the Internet

- The IP Protocol
- IP Addresses
- Internet Control Protocols
- OSPF – The Interior Gateway Routing Protocol
- BGP – The Exterior Gateway Routing Protocol
- Internet Multicasting
- Mobile IP
- IPv6
Design Principles for Internet

1. Make sure it works.
2. Keep it simple.
3. Make clear choices.
4. Exploit modularity.
5. Expect heterogeneity.
6. Avoid static options and parameters.
7. Look for a good design; it need not be perfect.
8. Be strict when sending and tolerant when receiving.
9. Think about scalability.
The Internet is an interconnected collection of many networks.
The IP Protocol

The IPv4 (Internet Protocol) header.

<table>
<thead>
<tr>
<th>Version</th>
<th>IHL</th>
<th>Type of service</th>

<td>Teach a router about geography</td>
</tr>
<tr>
<td>Echo request</td>
<td>Ask a machine if it is alive</td>
</tr>
<tr>
<td>Echo reply</td>
<td>Yes, I am alive</td>
</tr>
<tr>
<td>Timestamp request</td>
<td>Same as Echo request, but with timestamp</td>
</tr>
<tr>
<td>Timestamp reply</td>
<td>Same as Echo reply, but with timestamp</td>
</tr>
</tbody>
</table>

The principal ICMP message types.
ARP– The Address Resolution Protocol

Three interconnected /24 networks: two Ethernets and an FDDI ring.
Dynamic Host Configuration Protocol

Operation of DHCP.
OSPF – The Interior Gateway Routing Protocol

(a) An autonomous system.  
(b) A graph representation of (a).
The relation between ASes, backbones, and areas in OSPF.
### OSPF (3)

The five types of OSPF messages.

<table>
<thead>
<tr>
<th>Message type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hello</td>
<td>Used to discover who the neighbors are</td>
</tr>
<tr>
<td>Link state update</td>
<td>Provides the sender’s costs to its neighbors</td>
</tr>
<tr>
<td>Link state ack</td>
<td>Acknowledges link state update</td>
</tr>
<tr>
<td>Database description</td>
<td>Announces which updates the sender has</td>
</tr>
<tr>
<td>Link state request</td>
<td>Requests information from the partner</td>
</tr>
</tbody>
</table>
BGP – The Exterior Gateway Routing Protocol

(a) A set of BGP routers.  

(b) Information sent to F.

Information F receives from its neighbors about D:

From B: "I use BCD"
From G: "I use GCD"
From I: "I use IFGCD"
From E: "I use EFGCD"
## The Main IPv6 Header

**The IPv6 fixed header (required).**

<table>
<thead>
<tr>
<th>Version</th>
<th>Traffic class</th>
<th>Flow label</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
