LAB 11 – LINKED LISTS

Write a program, which maintains a linked list of Employees. For each employee you should store: Name and SSN number. Implement a class Employee with appropriate methods: setters’ methods, getters methods, …etc.
When your program starts up, it should read the data. You will maintain a linked list of employee’s objects.

Your program should be able to:
- Add an Employee at the last
- Delete an employee from the last
- Find an employee by name and print his data
- Print employees' names.

You should present a menu to the user as follows:

Choose one option:
1. Add an Employee
2. Delete an Employee
3. Find an Employee
4. Print names
5. Exit

A user should be able to continually use the system until he chooses ‘5’.
Make sure that if there are no employees on the list, you give an appropriate message.
