

[Solution Key]

**KING SAUD UNIVERSITY**  
COLLEGE OF SCIENCES  
DEPARTMENT OF MATHEMATICS  
Semester 471 / MATH-244 (Linear Algebra) / Mid-term Exam 2

Max. Marks: 25

Max. Time:  $1\frac{1}{2}$  hr**Question 2:** [Marks: 3 + 2]

I. Select the correct choice:

- (i) If  $W = \{(1,1), (1,2)\}$ , then  $W$  is:  
 (a) a vector space (b) a subspace of  $\mathbb{R}^2$  (c) ✓ a basis of  $\mathbb{R}^2$  (d) linearly dependent. [Mark 1]
- (ii) If  $B = \{u, v, w\}$  is an orthogonal set of non-zero vectors in an inner product space  $E$  and  $\alpha u + \beta v + \gamma w = 0$  for some scalars  $\alpha, \beta$  and  $\gamma$ , then:  
 (a) ✓  $\alpha = \beta = \gamma = 0$  (b)  $u = v = w$  (c)  $\alpha = \gamma, v = 0, u = w$  (d)  $B$  is linearly dependent. [Mark 1]
- (iii) If  $A$  is an invertible matrix of order 3, then  $\text{rank}(A)$  is equal to:  
 (a) 0 (b) 1 (c) 2 (d) ✓ 3. [Mark 1]

II. Give an example for each of the following. You don't have to prove your answers.

- (i) A linearly dependent subset of  $\mathbb{R}^3$  consisting of three vectors in which every two vectors are linearly independent.

Example:  $\{(1, 0, 0), (0, 1, 0), (1, 1, 0)\}$ . [Mark 1]

- (ii) A matrix having  $\text{rank}$  3 and  $\text{nullity}$  4.

Example: 
$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \end{bmatrix}$$

[Mark 1]

**Question 2:** [Marks: 4 + 3]

Let  $A = \begin{bmatrix} 1 & 1 & 2 & -3 & 5 \\ 2 & 3 & 0 & -1 & -6 \\ 3 & 4 & 2 & -4 & -1 \end{bmatrix}$ . Then:

- (i) Find bases for  $\text{row}(A)$  and  $\text{col}(A)$ .  
 (ii) Express the last three columns of the matrix  $A$  as linear combinations of the first two.

**Solution:** (i) From  $\text{RREF}(A) = \begin{bmatrix} 1 & 0 & 6 & -8 & 21 \\ 0 & 1 & -4 & 5 & -16 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$ :

[Marks 2]

Basis for  $\text{row}(A) = \{(1, 0, 6, -8, 21), (0, 1, -4, 5, -16)\}$ , Basis for  $\text{col}(A) = \left\{ \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}, \begin{bmatrix} 1 \\ 3 \\ 4 \end{bmatrix} \right\}$ .

[Marks 1+1]

(ii)  $\begin{bmatrix} 2 \\ 0 \\ 2 \end{bmatrix} = 6 \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} - 4 \begin{bmatrix} 1 \\ 3 \\ 4 \end{bmatrix}$ ,  $\begin{bmatrix} -3 \\ -1 \\ -4 \end{bmatrix} = -8 \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} + 5 \begin{bmatrix} 1 \\ 3 \\ 4 \end{bmatrix}$  and  $\begin{bmatrix} 5 \\ -6 \\ -1 \end{bmatrix} = 21 \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} - 16 \begin{bmatrix} 1 \\ 3 \\ 4 \end{bmatrix}$ .

[Marks 1+1+1]

**Question 3:** [Marks: 3 + 4]

- (i) Let  $F = \{p = 2 - x, q = 5 + 3x - x^2 + 2x^3, r = 1 + 7x + x^2 + 4x^3\}$ . Find the real numbers  $\alpha, \beta, \gamma$  so that  $-3 + 5x^2 + 2x^3 = \alpha p + \beta q + \gamma r$ . Also, show that the set  $F$  is linearly independent in the vector space  $P_3$ .  
 (ii) Let  $G = \{v_1, v_2, v_3, v_4, v_5, v_6\}$  be a basis of the vector space  $\mathbb{R}^6$ . Let  $A$  be a  $4 \times 6$  matrix such that  $A(v_1)$  and  $A(v_2)$  are linearly independent vectors in  $\mathbb{R}^4$  and  $A(v_i) = 0$ , for all  $i = 3, 4, 5, 6$ . Show that the null space  $N(A) = \text{span}(\{v_3, v_4, v_5, v_6\})$ . Also, find  $\text{nullity}(A^T)$ .

**Solution:** (i) Substituting the values of polynomials  $p, q, r$  in  $-3 + 5x^2 + 2x^3 = \alpha p + \beta q + \gamma r$ , and then equating the coefficients of the same degree terms, we get that:  $-3 = 2\alpha + 5\beta + \gamma$ ,  $0 = -\alpha + 3\beta + 7\gamma$ ,  $5 = 0\alpha - \beta + \gamma$ ,  $2 = 0\alpha + 2\beta + 4\gamma$ .

Solving this linear system, we obtain:  $\alpha = 5, \beta = -3$  and  $\gamma = 2$ . [Marks 2]Also,  $\alpha p + \beta q + \gamma r = 0 \Rightarrow \alpha = \beta = \gamma = 0$ . Hence, the set  $F$  is linearly independent in the vector space  $P_3$ . [Mark 1]

- (ii)  $u \in N(A) \Rightarrow 0 = A(u) = A(\sum_{i=1}^6 \alpha_i v_i) = \sum_{i=1}^6 \alpha_i A(v_i) = \alpha_1 A(v_1) + \alpha_2 A(v_2) \Rightarrow \alpha_1 = \alpha_2 = 0$ . So,  $u = \sum_{i=3}^6 \alpha_i v_i$ .

Hence,  $N(A) \subseteq \text{span}(\{v_3, v_4, v_5, v_6\}) \subseteq N(A)$ . Thus,  $N(A) = \text{span}(\{v_3, v_4, v_5, v_6\})$ , and so: [Marks 2] $\text{nullity}(A^T) = 4 - \text{rank}(A^T) = 4 - \text{rank}(A) = 4 - (6 - \text{nullity}(A)) = 4 - (6 - 4) = 4 - 2 = 2$ . [Marks 2]**Question 4:** [Marks: 3 + 3]

- (i) Consider a vector space  $E$  of dimension 3. Let  $B = \{u_1, u_2, u_3\}$  and  $C = \{v_1, v_2, v_3\}$  be two ordered bases for  $E$  such that the transition matrix  ${}_C P_B = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 0 \\ 1 & 0 & 1 \end{bmatrix}$  from  $B$  to  $C$ . Compute the coordinate vector  $[v_1 - 2v_2 + 3v_3]_B$ .  
 (ii) Consider the matrices  $A = \begin{bmatrix} 2 & 0 \\ 0 & -1 \end{bmatrix}$ ,  $B = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}$  in the inner product space  $M_2(\mathbb{R})$ , consisting of all real matrices of size 2, with inner product  $\langle A, B \rangle = \text{trace}(AB^T)$ . Find the angle between the matrices  $A$  and  $B$ . Also, verify the Pythagorean theorem for the same matrices.

**Solution:** (i)  ${}_B P_C = ({}_C P_B)^{-1} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 0 \\ 1 & 0 & 1 \end{bmatrix}^{-1} = \begin{bmatrix} -1 & 1 & 1 \\ 1 & 0 & -1 \\ 1 & -1 & 0 \end{bmatrix}$  and  $[v_1 - 2v_2 + 3v_3]_C = \begin{bmatrix} 1 \\ -2 \\ 3 \end{bmatrix}$ . Hence: [Marks 2]

$[v_1 - 2v_2 + 3v_3]_B = {}_B P_C [v_1 - 2v_2 + 3v_3]_C = \begin{bmatrix} -1 & 1 & 1 \\ 1 & 0 & -1 \\ 1 & -1 & 0 \end{bmatrix} \begin{bmatrix} 1 \\ -2 \\ 3 \end{bmatrix} = \begin{bmatrix} 0 \\ -2 \\ 3 \end{bmatrix}$ .

[Mark 1]

- (ii)  $\langle A, B \rangle = \text{trace}(AB^T) = \text{trace}\left(\begin{bmatrix} 2 & 0 \\ 0 & -1 \end{bmatrix}\right) = 0$ , so that the angle  $\theta$  between the matrices  $A$  and  $B$ :

$\theta = \cos^{-1} \frac{\langle A, B \rangle}{\|A\| \|B\|} = \cos^{-1} 0 = \frac{\pi}{2}$ . Hence,  $A$  and  $B$  are orthogonal matrices. [Mark 1]

Next,  $\|A\| = \sqrt{\langle A, A \rangle} = \sqrt{\text{trace}(AA^T)} = \sqrt{\text{trace}\left(\begin{bmatrix} 4 & 0 \\ 0 & 1 \end{bmatrix}\right)} = \sqrt{5}$ . Similarly,  $\|B\| = \sqrt{\text{trace}\left(\begin{bmatrix} 1 & 0 \\ 0 & 4 \end{bmatrix}\right)} = \sqrt{5}$  and

$\|A + B\| = \left\| \begin{bmatrix} 3 & 0 \\ 0 & 1 \end{bmatrix} \right\| = \sqrt{\text{trace}\left(\begin{bmatrix} 9 & 0 \\ 0 & 1 \end{bmatrix}\right)} = \sqrt{10}$ . So,  $\|A + B\|^2 = 10 = 5 + 5 = \|A\|^2 + \|B\|^2$ ; as required. [Marks 2]
