

## "Continuous probability distribution"

t-distribution of continuous r.v.  $T$  with parameter  $v = \text{d.f.}$   
 ( $v = \text{d.f.}$  is degrees of freedom) i.e.  $T \sim t(v)$ :

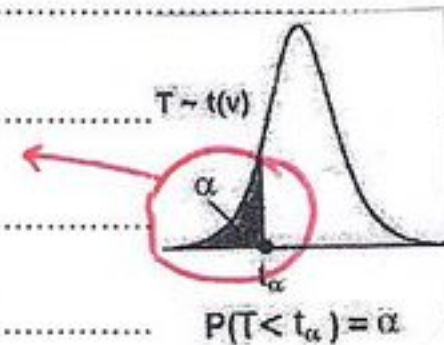

"total area under the curve equals to 1"

- ①  $T$  is continuous random variable ( $-\infty < T < \infty$ ).
- ② The shape of  $t$ -distribution is similar to the shape of the standard normal distribution and  
 $t$ -distribution  $\rightarrow$  standard normal distribution as  $v \rightarrow \infty$ .

- ③ mean = 0
- ④ the curve is symmetric about the mean = 0.

⑤  $P(T < t_\alpha) = \alpha$  with degrees of freedom  $v$

the area left  $t_\alpha$  is equals to  $\alpha$

as  $T$  is symmetric about 0, then  $t_\alpha = -t_{1-\alpha}$ .
