College of Science, Chemistry Department

# Aromatic Hydrocarbons

2

- Originally called **aromatic** due to fragrant odors, although this definition seems inaccurate as many products possess distinctly non-fragrant smells!
- Currently a compound is said to be aromatic if it has **benzene-like in its properties**.

- Benzene** is the **parent hydrocarbon of aromatic compounds**, because of their special chemical properties.

# The Structure of Benzene Ring

3

- Molecular formula =  $C_6H_6$   
The carbon-to-hydrogen ratio in benzene, suggests a *highly unsaturated structure*.
- Benzene reacts mainly by *substitution*.  
It does not undergo the typical addition reactions of alkenes or alkynes.
- **Kekulé Structure for Benzene**
  - He suggested that
    - *six carbon atoms* are located at the corners of *a regular hexagon*, with one hydrogen atom attached to each carbon atom.
    - *single and double bonds alternate* around the ring (conjugated system of double bonds) and exchange positions around the ring.

the Kekulé structures for benzene

# The Structure of Benzene Ring

4

## ○ Resonance Model for Benzene.

- Benzene is **planar**.
- All of the **carbon-carbon bond lengths** are identical: **1.39 Å**, intermediate between typical *single* (1.54 Å) and *double* (1.34 Å) carbon-carbon bond lengths.
- Each carbon is therefore **sp<sup>2</sup>-hybridized**.
- Bond angles of 120°.

# Aromatic Character (Aromaticity)

5

**To be classified as aromatic, a compound must have:**

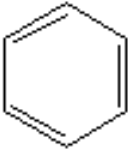

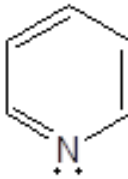

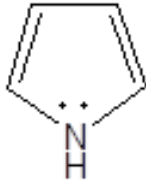

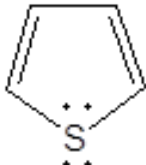

- ① Cyclic structure
- ② Cyclic structure contains what looks like a continuous system of alternating double and single bonds.
- ③ Aromatic compounds must be planar
- ④ Fulfill Huckel rule

*The number of  $\pi$  electrons in the compound =  $(4n + 2)$*

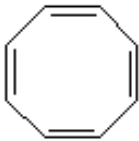

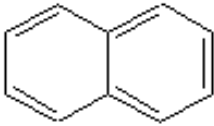

Where ( $n = 0, 1, 2, 3$ , and so on).

# Aromatic Character (Aromaticity)

6

| $n$ | $4n + 2$ | Structure and name of aromatic compound  |   |   |   |   |
|-----|----------|--|---|---|---|---|
| 1   | 6        |  |  |  |  |  |
|     |          | Benzene  | Pyridine  | Pyrrole   | Furan   | Thiophene   |

## Examples

|          |   |   |   |   |   |
|----------|---|---|---|---|---|
|          |    |    |    |    |  |
| $4n+2 =$ | 8   | 10  | 2   | 2   | 4   |
| $n =$    | 1.5   | 2   | 0   | 0   | 0.5   |
|          |  |  |  |  |   |
| $4n+2 =$ | 4   | 4   | 6   | 4   |   |
| $n =$    | 0.5   | 0.5   | 1   | 0.5   |   |

# Nomenclature of Aromatic Compounds

- **Monosubstituted benzenes** that do not have common names accepted by IUPAC are named as derivatives of benzene.

Common names are accepted by IUPAC (parent compounds).

# Disubstituted Benzenes

## Nomenclature of Aromatic Compounds

8

- When **two substituents** are present, *three isomeric structures are possible*.
  - They are designated by the prefixes; **ortho- (o-)**, **meta- (m-)** and **para- (p-)**.
  - If substituent X is attached to carbon 1;
    - **o- groups** are on **carbons 2 and 6**,
    - **m- groups** are on **carbons 3 and 5**, and
    - **p- groups** are on **carbon 4**.

### ○ Examples;

*ortho*-dichloro-  
benzene

*meta*-dichloro-  
benzene

*para*-dichloro-  
benzene

*para*-xylene\*

*o*-bromochlorobenzene  
(note alphabetical order)

*m*-nitrotoluene

*p*-chlorostyrene

*m*-chlorophenol

# Polysubstituted Benzenes

## Nomenclature of Aromatic Compounds

9

- When **more than two substituents** are present, their positions are designated by **numbering the ring**.

# Nomenclature of Aromatic Compounds

- Two groups with special names occur frequently in aromatic compounds; the **phenyl group** and the **benzyl group**.

- **Examples;**

# Electrophilic Substitution Reactions

## Reactions of Benzene

### 1) Halogenation

### 2) Nitration

### 3) Sulfonation

### 4) Alkylation (Friedel-Crafts)

### 5) Acylation (Friedel-Crafts)

# The Mechanism of Electrophilic Substitution Reactions

## Reactions of Benzene

12

We can generalize this two-step mechanism for all the electrophilic aromatic substitutions.

### 1) Halogenation

# The Mechanism of Electrophilic Substitution Reactions

## Reactions of Benzene

13

### 2) Nitration

In aromatic nitration reactions, the **sulfuric acid catalyst** protonates the **nitric acid**, which then loses water to generate the **nitronium ion** ( $\text{NO}_2^+$ ), which contains a positively charged nitrogen atom.

### 3) Sulfonation

We use either concentrated or **fuming sulfuric acid**, and the electrophile may be sulfur trioxide,  $\text{SO}_3$ , or **protonated sulfur trioxide**,  $^+\text{SO}_3\text{H}$ .

## Electrophilic Aromatic Substitution Reactions

14

### 4) Friedel–Crafts Alkylation

The *electrophile is a carbocation*, which can be formed either by removing a halide ion from an *alkyl halide* with a *Lewis acid catalyst* (for example,  $AlCl_3$ ) .

## Electrophilic Aromatic Substitution Reactions

15

### 5) Friedel–Crafts Acylation

The *electrophile is an acyl cation* generated from an acid derivative, usually an *acyl halide*. The reaction provides a useful general route to aromatic ketones.

## Disubstituted Benzenes: Orientation

16

- Substituents already present on an aromatic ring determine the position taken by a new substituent.
- **Example; nitration of toluene** gives mainly a mixture of *o*- and *p*-nitrotoluene.

- On the other hand, **nitration of nitrobenzene** under similar conditions gives mainly the *meta* isomer.

## Disubstituted Benzenes: Orientation & Reactivity

17

### Directing and Activating Effects of Common Functional Groups

- Substituents that **release electrons** to the ring will **activate the ring** toward electrophilic substitution.
- Substituents that **withdraw electrons** from the ring will **deactivate the ring** toward electrophilic substitution.

|                       | Substituent group   | Name of group            |              |
|-----------------------|---|--------------------------|--------------|
| Ortho, Para-Directing | $\text{--}\ddot{\text{N}}\text{H}_2, \text{--}\ddot{\text{N}}\text{HR}, \text{--}\ddot{\text{N}}\text{R}_2$                 | amino                    | Activating   |
|                       | $\text{--}\ddot{\text{O}}\text{H}, \text{--}\ddot{\text{O}}\text{CH}_3, \text{--}\ddot{\text{O}}\text{R}$                   | hydroxy, alkoxy          |              |
|                       | $\begin{array}{c} \text{O} \\ \parallel \\ \text{--}\ddot{\text{N}}\text{HC--R} \end{array}$                                | acylamino                |              |
|                       | $\text{--CH}_3, \text{--CH}_2\text{CH}_3, \text{--R}$   | alkyl                    |              |
|                       | $\text{--}\ddot{\text{F}}:, \text{--}\ddot{\text{Cl}}:, \text{--}\ddot{\text{Br}}:, \text{--}\ddot{\text{I}}:$              | halo                     |              |
| Meta-Directing        | $\begin{array}{c} \text{:O:} \\ \parallel \\ \text{--C--R} \end{array}$   | acyl, carboxy            | Deactivating |
|                       | $\begin{array}{c} \text{:O:} \\ \parallel \\ \text{--C--}\ddot{\text{O}}\text{H} \end{array}$                               |                          |              |
|                       | $\begin{array}{c} \text{:O:} \\ \parallel \\ \text{--C--}\ddot{\text{N}}\text{H}_2 \end{array}$                             | carboxamido, carboalkoxy |              |
|                       | $\begin{array}{c} \text{:O:} \\ \parallel \\ \text{--C--}\ddot{\text{O}}\text{R} \end{array}$                               |                          |              |
|                       | $\begin{array}{c} \text{:O:} \\ \parallel \\ \text{--S--}\ddot{\text{O}}\text{H} \\ \parallel \\ \text{:O:} \end{array}$    | sulfonic acid            |              |
|                       | $\text{--C}\equiv\text{N:}$   | cyano                    |              |
|                       | $\begin{array}{c} \text{:O:} \\ \parallel \\ \text{--N}^+\text{--}\ddot{\text{O}}^- \\ \parallel \\ \text{:O:} \end{array}$ | nitro                    |              |

## Side-Chain Reactions of Benzene-Derivatives

18

### 1. Halogenation of an Alkyl Side Chain

## Side-Chain Reactions of Benzene-Derivatives

19

### 2. Oxidation of an Alkyl Side Chain

- Conversion into a carboxyl group,  $-\text{COOH}$ , by treatment with **hot potassium permanganate**.
- Regardless the **length of the alkyl chain**, the product is always the same.
