Performance Issues

- Many strategies for getting good performance have been learned over time
 - Performance problems »
 - Measuring network performance »
 - Host design for fast networks »
 - Fast segment processing »
 - Header compression »
 - Protocols for “long fat” networks »

Performance Problems

- Unexpected loads often interact with protocols to cause performance problems
 - Need to find the situations and improve the protocols
- Examples:
 - Broadcast storm: one broadcast triggers another
 - Synchronization: a building of computers all contact the DHCP server together after a power failure
 - Tiny packets: some situations can cause TCP to send many small packets instead of few large ones

Measuring Network Performance

- Measurement is the key to understanding performance – but has its own pitfalls.
- Example pitfalls:
 - Caching: fetching Web pages will give surprisingly fast results if they are unexpectedly cached
 - Timing: clocks may over/underestimate fast events
 - Interference: there may be competing workloads

Host Design for Fast Networks

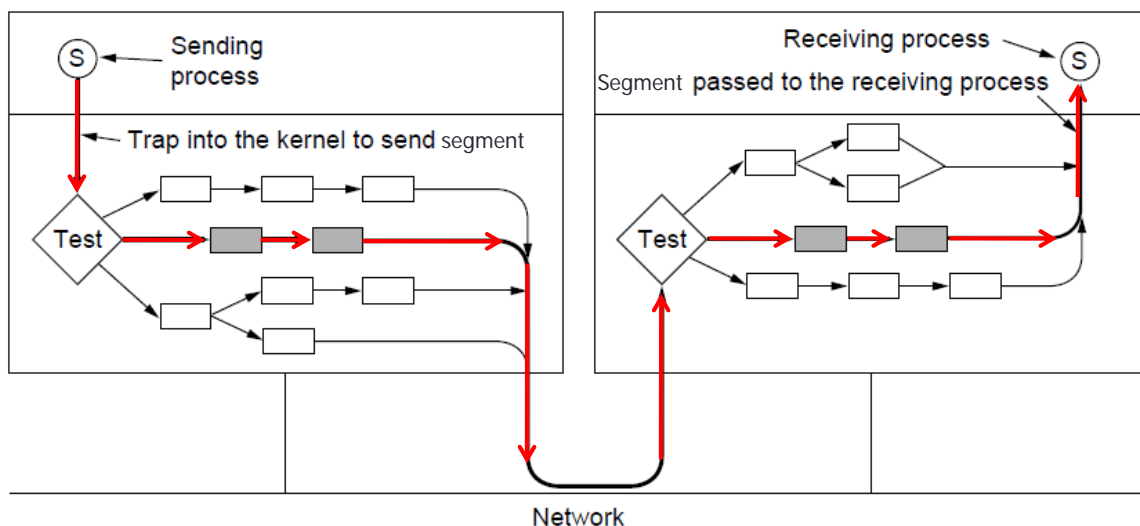

- Poor host software can greatly slow down networks.
- Rules of thumb for fast host software:
 - Host speed more important than network speed
 - Reduce packet count to reduce overhead
 - Minimize data touching
 - Minimize context switches
 - Avoiding congestion is better than recovering from it
 - Avoid timeouts

Fast Segment Processing

Speed up the common case with a **fast path**

- Handles packets with expected header; OK for others to run slowly

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Fast Segment Processing

Header fields are often the same from one packet to the next for a flow;
copy/check them to speed up processing

Source port		Destination port	
Sequence number			
Acknowledgement number			
Len	Unused	Window size	
Checksum		Urgent pointer	

TCP header fields that stay the same for a one-way flow (shaded)

VER.	IHL	TOS	Total length	
Identification			Fragment offset	
TTL		Protocol	Header checksum	
Source address				
Destination address				

IP header fields that are often the same for a one-way flow (shaded)

Header Compression

- Overhead can be very large for small packets
 - 40 bytes of header for RTP/UDP/IP VoIP packet
 - Problematic for slow links, especially wireless
- Header compression mitigates this problem
 - Runs between Link and Network layer
 - Omits fields that don't change or change predictably
 - 40 byte TCP/IP header → 3 bytes of information
 - Gives simple high-layer headers and efficient links

Protocols for “Long Fat” Networks

- Networks with high bandwidth (“Fat”) and high delay (“Long”) can store much information inside the network
 - Requires protocols with ample buffering and few RTTs, rather than reducing the bits on the wire

Starting to send 1 Mbit
San Diego → Boston

20ms after start

40ms after start

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Protocols for “Long Fat” Networks

- You can buy more bandwidth but not lower delay
 - Need to shift ends (e.g., into cloud) to lower further

Minimum time to send and ACK a 1-Mbit file over a 4000-km line
