Mongi BLEL

Elimination
Method

Systems of ordinary differential equations arise in problems involving several dependent variables, each of which is a function of a single independent variable. We will use the following notations: $D = d/dt$, $D^2 = d^2/dt^2, \ldots, D^n = d^n/dt^n$, where t is the independent variable. We may denote by y, u, v, w, z and so on for the dependent variables which are functions of t.

For example, the motion of a particle in space is governed by a system of the three following equations:

$$\begin{cases} mD^2u = f_1(t, u, v, w, D^1u, D^1v, D^1w) \\ mD^2v = f_2(t, u, v, w, D^1u, D^1v, D^1w) \\ mD^2w = f_3(t, u, v, w, D^1u, D^1v, D^1w), \end{cases}$$

Ordinary
Differential
Equations
Systems With

Coefficients

Mongi BLEL

Elimination
Method

where m is the mass of the particle, u, v, w are its spacial coordinates and f_1, f_2, f_3 are the forces acting on the particle the u, v and w directions respectively. We will use the method of elimination to solve linear systems of ordinary differential equations with constant coefficients. For systems of only two or three first order equations such method is quite efficient. It can be applied to nonhomogeneous systems as well as to homogeneous ones.

Elimination Method

The method of elimination can also be used to solve systems of higher order equations.
Consider the following system

$$\begin{cases} L_1[x] + L_2[y] = F_1(t), \\ L_3[x] + L_4[y] = F_2(t), \end{cases} \tag{1}$$

where $L_1, L_2, L_3,$ and L_4 are linear differential operators with constant coefficients, and $F_1(t)$ and $F_2(t)$ are given functions. The system (1) is written in its operator form. The operators $L_i,\ i = 1, 2, 3, 4$ are commutative, that is

$$L_1 L_2[x] = L_2 L_1[x], L_1 L_3[x] = L_3 L_1[x], L_2 L_4[x] = L_4 L_2[x],$$

and so on.

Ordinary
Differential
Equations
Systems With

Coefficients

Mongi BLEL

Elimination
Method

For example if

$$L_1[x] = (aD + b)[x]$$

and

$$L_2[x] = (cD + d)[x],$$

where a, b, c and d are constants, then we have

$$\begin{aligned} L_1L_2[x] &= aD\left((cD + d)[x]\right) + b\left((cD + d)[x]\right) \quad (2) \\ &= \left(acD^2 + (ad + bc)D + bd\right)[x], \end{aligned}$$

and

$$\begin{aligned} L_2L_1[x] &= cD\left((aD + b)[x]\right) + d\left((aD + b)[x]\right) \quad (3) \\ &= \left(caD^2 + (cb + da)D + db\right)[x]. \end{aligned}$$

It follows from (2) and (3) that

$$L_1L_2[x] = L_2L_1[x].$$

Mongi BLEL

Elimination
Method

Suppose now we want to solve System (1) by using the elimination method. To eliminate x we apply L_3 to first equation and L_1 to the second equation, we have

$$L_3 L_1[x] + L_3 L_2[y] = L_3[F_1],$$

$$L_1 L_3[x] + L_1 L_4[y] = L_1[F_2].$$

Then substrate the first from the second to obtain

$$L_1 L_4[y] - L_3 L_2[y] = L_1[F_2] - L_3[F_1].$$

Equation (9) can be solved for y and then x can be found from either the first or second equation in (1).

Ordinary

Mongi BLEL

Elimination
Method

Example

Find the general solution of the system

$$
\begin{cases}
\frac{d^2x}{dt^2} + \frac{d^2y}{dt^2} + \frac{dx}{dt} - 3\frac{dy}{dt} - x + 2y = 0, \\
\frac{dx}{dt} + 2\frac{dy}{dt} + 2x - 4y = 0.
\end{cases}
$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Solution.

We first write the system (1) in its operator form

$$\begin{cases} (D^2 + D - 1)[x] + (D^2 - 3D + 2)[y] = 0, \\ (D + 2)[x] + (2D - 4)[y] = 0. \end{cases}$$

To eliminate x, we apply the operator $D^2 + D - 1$ to the second equation in (11) and $D + 2$ to the first one and substrate the first from the second, we get

$$\left((D^2 + D - 1)(2D - 4) - (D + 2)(D^2 - 3D + 2)\right)[y] = 0,$$

or

$$\left(D^3 - D^2 - 2D\right)[y] = 0 \Leftrightarrow y''' - y'' - 2y' = 0.$$

The characteristic equation for Eq (11) is

$$m^3 - m^2 - 2m = 0$$

whose roots are $0, 2, -1$. Thus

$$y(t) = c_1 + c_2 e^{2t} + c_3 e^{-t}$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Substitution of this last expression in the second equation of system (1) gives

$$x' + 2x = 4c_1 + 6c_3 e^{-t}.$$

We now solve the linear Equation (12), to obtain

$$x(t) = 2c_1 + 6c_3 e^{-t} + c_4 e^{-2t}.$$

To eliminate the constant c_4 from the solution $x(t)$, we replace $x(t)$ and $y(t)$ in the first equation in (11) and we find $c_4 = 0$. Consequently

$$x(t) = 2c_1 + 6c_3 e^{-t}$$

Ordinary

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Solution.

The system (9) can be written in the operator form

$$\begin{cases} (D-1)[x] + y = t, \\ (D-3)[y] - x = -3t. \end{cases}$$

To eliminate y, we apply $D - 3$ to Eq (1) and substrate the second from the first, we obtain

$$\left(D^2 - 4D + 4\right)[x] = 1 \Leftrightarrow x'' - 4x' + 4x = 1.$$

The characteristic equation for the homogeneous equation in Eq (14) is

$$m^2 - 4m + 4 = 0,$$

which has the double root $m = 2$. Thus the general solution of the homogeneous equation

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

is

$$x'' - 4x' + 4x = 0$$

is

$$x_c(t) = (c_1 + c_2 t)e^{2t}.$$

We then use for example the method of undetermined coefficients to find that $x_p = 1/4$. thus the general solution of the nonhomogeneous (14) is given by

$$x(t) = (c_1 + c_2 t)e^{2t} + 1/4.$$

We deduce from the first equation in (2) that

$$y(t) = t + 1/4 - (c_1 + c_2 + c_2 t)e^{2t}.$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Solution.

We first write the system (3) in its operator form

$$\begin{cases} (D^2 - 3D + 2)[x] + (D - 1)[y] = 0, \\ (D - 2)[x] + (D + 1)[y] = 0. \end{cases}$$

To eliminate y, we apply $(D + 1)$ to the first equation in (17) and $(D - 1)$ to the second and substract the first from the second, we get

$$\left(D^3 - 3D^2 + 2D\right)[x] = 0 \Leftrightarrow x''' - 3x'' + 2x' = 0.$$

The general solution of Eq (17) is

$$x(t) = c_1 + c_2 e^{2t} + c_3 e^t.$$

From Eq (2) in (3), we have

$$y' + y = c_3 e^t + 2c_1.$$

We solve the linear equation (17) to obtain

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

To eliminate the extra constant c_4, we substitute $x(t)$ and $y(t)$ in the first equation in (3) and find that $c_4 = 0$. Hence

$$y(t) = 2c_1 + \frac{c_3}{2}e^t.$$

Method

Example

Solve the initial value problem

$$\begin{cases} x' + 5y - 2x = -\sin 2t, & x(0) = 0 \\ y' - x + 2y = t, & y(0) = 1, \end{cases}$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Solution.

The system (4) has the operator form

$$\begin{cases} (D-2)[x] + 5y = -\sin 2t, \\ (D+2)[y] - x = t. \end{cases}$$

To eliminate x, we apply $(D-2)$ to the second equation and sum both equations, we obtain

$$(D^2 - 4)[y] + 5y = 1 - 2t - \sin 2t \Leftrightarrow y'' + y = 1 - 2t - \sin 2t.$$

To find the general solution of Eq (20), it is better to use the method of undetermined coefficients. We find that

$$y_c = c_1 \cos t + c_2 \sin t,$$

and

$$y_p = 1 - 2t + \frac{1}{3} \sin 2t.$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Thus

$$y(t) = c_1 \cos t + c_2 \sin t + 1 - 2t + \frac{1}{3} \sin 2t.$$

From the second equation in (4), we have

$$x(t) = (2c_2 - c_1) \sin t + (c_2 + 2c_1) \cos t - 5t + \frac{2}{3} \sin 2t + \frac{2}{3} \cos 2t.$$

Initial conditions give $c_1 = 0$, and $c_2 = -\frac{2}{3}$. Then we get

$$x(t) = \frac{-4}{3} \sin t - \frac{2}{3} \cos t - 5t + \frac{2}{3} \sin 2t + \frac{2}{3} \cos 2t,$$

and

$$y(t) = \frac{-2}{3} \sin t + \frac{1}{3} \sin 2t + 1 - 2t.$$

Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Solution.

We write the system (5) in the operator form

$$\begin{cases} \frac{1}{2}D^3[x] - D^2[y] = \cos t, \\ (\frac{1}{2}D^2 + 1)[x] + D[y] = -\cos t. \end{cases}$$

To eliminate y, we apply the operator D to the second equation and then sum both equations

$$(D^3 + D)[x] = \sin t + \cos t \Leftrightarrow x''' + x' = \sin t + \cos t.$$

By using the method of undetermined coefficients method, we find that the general solution of equation (23) is given by

$$x(t) = c_1 + c_2 \cos t + c_3 \sin t - \frac{t}{2}(\cos t + \sin t).$$

Substitution of the expression (23) in the second equation of (5) gives

$$y(t) = (\frac{3}{2} + \frac{c_3}{2} - \frac{t}{4})\cos t + (-\frac{1}{4} - \frac{c_2}{2} + \frac{t}{4})\sin t - c_1 t + c_4.$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

To eliminate the extra constant c_4, we substitute for $x(t)$ and $y(t)$ in the second equation in (5) and find that $c_4 = 0$. Hence

$$y(t) = (\frac{3}{2} + \frac{c_3}{2} - \frac{t}{4})\cos t + (-\frac{1}{4} - \frac{c_2}{2} + \frac{t}{4})\sin t - c_1 t.$$

Ordinary

Mongi BLEL

Elimination
Method

Example

Solve the initial value problem

$$\begin{cases} x'' - y = e^t, & x(0) = 0, \ y(0) = 0, \\ y'' - x = 0, & x'(0) = 0, \ y'(0) = 0. \end{cases}$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Solution. We write the system (6) in its operator form

$$\begin{cases} D^2[x] - y = e^t \\ D^2[y] - x = 0. \end{cases}$$

To eliminate y, we operate by D^2 on the first differential equation in (6) and then sum with the second equation, we obtain

$$x^{(4)} - x = e^t.$$

We look for

$$x(t) = x_c(t) + x_p(t).$$

We solve the homogeneous equation

$$x^{(4)} - x = 0,$$

and find that

$$x_c(t) = c_1 e^t + c_2 e^{-t} + c_3 \cos t + c_4 \sin t.$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Then we use the undetermined coefficients method to find that
$$x_p(t) = \frac{t}{4}e^t.$$

Hence
$$x(t) = c_1 e^t + c_2 e^{-t} + c_3 \cos t + c_4 \sin t + \frac{t}{4}e^t.$$

From the first equation in (26), we get
$$y(t) = c_1 e^t + c_2 e^{-t} - c_3 \cos t - c_4 \sin t + \frac{t}{4}e^t - \frac{1}{2}e^t.$$

We now determine the constants c_i, $i = 1, 2, 3, 4$. The above initial conditions give the algebraic system

$$\begin{cases} c_1 + c_2 + c_3 = 0 \\ c_1 + c_2 - c_3 - \frac{1}{2} = 0 \\ c_1 - c_2 + c_4 + \frac{1}{4} = 0 \\ c_1 - c_2 - c_4 - \frac{1}{4} = 0. \end{cases}$$

Ordinary
Differential
Equations
Systems With
Constant

Mongi BLEL

Elimination
Method

Solution.

The system (4) has the operator form

$$\begin{cases} (D^2 + 1)[x] + (1 - D)[y] = 0 \\ (D + 1)[x] + (D^2 - 1)[y] = 0. \end{cases}$$

To eliminate y, we apply the operator $D + 1$ to the first equation in (30) and add the resulted equation to the second equation, we obtain

$$(D + 1)(D^2 + 1)[x] + (D + 1)[x] = 0 \Leftrightarrow x''' + x'' + 2x' + 2x = 0.$$

The general solution of Eq (30) is given by

$$x(t) = c_1 e^{-t} + c_2 \cos \sqrt{2}t + c_3 \sin \sqrt{2}t.$$

From the first equation in (7), we have the equation

$$y' - y = 2c_1 e^{-t} - c_2 \cos \sqrt{2}t - c_3 \sin \sqrt{2}t.$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

The differential equation (30) is a linear equation, we solve it
and find that

$$y(t) = -c_1 e^{-t} + \frac{c_2}{3} \cos \sqrt{2}t - \frac{c_2\sqrt{2}}{3} \sin \sqrt{2}t + \frac{c_3}{3} \sin \sqrt{2}t + \frac{c_3\sqrt{2}}{3} \cos$$

In the same way as before we find $c_4 = 0$. Hence

$$y(t) = -c_1 e^{-t} + \frac{c_2}{3} \cos \sqrt{2}t - \frac{c_2\sqrt{2}}{3} \sin \sqrt{2}t + \frac{c_3}{3} \sin \sqrt{2}t + \frac{c_3\sqrt{2}}{3} \cos$$

Ordinary
Differential
Equations
Systems With
Constant
Coefficients

Mongi BLEL

Elimination
Method

Solution.

We first write the system (10) in its operator form

$$\left\{ \begin{array}{c} D^3[x] - y = 0 \\ D[y] - x = \frac{1}{8}e^{2t} - \frac{1}{8}\sin 2t. \end{array} \right.$$

In order to eliminate the unknown x, we apply the operator D^3 to the second equation in (39) and sum with the first one, we get

$$(D^4 - 1)[y] = e^{2t} + \cos 2t \Leftrightarrow y^{(4)} - y = e^{2t} + \cos 2t.$$

Equation (39) has the general solution

$$y(t) = y_p(t) + y_c(t),$$

that is

$$y(t) = c_1 e^t + c_2 e^{-t} + c_3 \cos t + c_4 \sin t + \frac{1}{15}e^{2t} + \frac{1}{15}\cos 2t.$$

It follows from the second equation in (10) and (39) that
