

Exercises 8

The criteria of Decision-Making Under Uncertainty is summarized as follows:

- (i) **Optimism criterion (Maximax for profit) or (Minimin for cost)**
 1. Locate the maximum payoff values corresponding to each decision alternative.
 2. Select a decision alternative with best payoff value (maximum for profit).
- (ii) **Pessimism criterion (Maximin for profit) or (Minimax for cost)**
 1. Locate the minimum payoff value corresponding to each decision alternative.
 2. Select a decision alternative with the best payoff value (maximum for profit).
- (iii) **Laplace criterion _ Equal probabilities**
 1. Assign equal probability value to each state of nature by using the formula:

$$1 \div (\text{number of states of nature}).$$
 2. Compute the expected (or average) payoff for each alternative by adding all the payoffs and dividing by the number of possible states of nature.
 3. Select the best expected payoff value (Maximum for profit Minimum for cost).
- (iv) **Hurwicz criterion**
 1. He gives a probability of optimism (alpha) and then a probability of pessimism (1 - alpha).
 2. Then Evaluate the expected value for each alternative as follows:

$$V(a_i) = \alpha \left(\begin{array}{l} \text{maximum profit} \\ \text{or minimum cost} \end{array} \right) + (1 - \alpha) \left(\begin{array}{l} \text{minimum profit} \\ \text{or maximum cost} \end{array} \right)$$
 3. Select an alternative with best expected value .
- (v) **Savage or Regret criterion (Minmax)**
 1. from the given payoff matrix, develop an opportunity-loss (or regret) matrix as follows:
 - Find the best payoff corresponding to each state of nature
 - Subtract all other payoff values in that row from this value.
 2. For each decision alternative identify the worst (maximum) payoff value. Record this value in the new row.
 3. Select a decision alternative resulting in a smallest anticipated opportunity-loss value.

The criteria of DECISION-MAKING UNDER RISK are summarized as follows:

- (i) **Expected Monetary Value (EMV) or Expected payoff criterion (E).**
 1. Construct a payoff matrix listing all possible courses of action and states of nature.
 2. Calculate the EMV for each course of action by multiplying the conditional payoffs by the associated probabilities and adding these weighted values for each course of action

$$EMV = \sum_{i=1}^m r_{ij} p_i$$
 3. Select the course of action that yields the optimal EMV.
- (ii) **Expected Opportunity Loss (EOL)**
 1. Prepare a conditional payoff values matrix for each combination of course of action and state of nature along with the associated probabilities.
 2. For each state of nature calculate the conditional opportunity loss (COL) values by subtracting each payoff from the maximum payoff.
 3. Calculate the EOL for each course of action by multiplying the probability of each state of nature with the COL value and then adding the values.

$$EOL = \sum_{i=1}^m L_{ij} p_i, L_{ij}: \text{opportunity loss due to state of nature } i \text{ and course of action } j$$
 4. Select a course of action for which the EOL is minimum.
- (iii) **Maximum (most) Likelihood (ML):** Consider the highest probability column, then take the Max for the profit table or take the Min for the cost table.
- (iv) **Expected Value of Perfect Information (EVPI)**

$$EVPI = (\text{Expected profit with perfect information}) - (\text{Expected profit without perfect information})$$

$$EVPI = \sum_{i=1}^m MAX(r_{ij})p_i - EMV$$

Example: An agricultural company wants to decide which commodity should stock to get maximum profit. It was supplied with the following information. The probability that the monsoon will be excess, normal and deficient is 0.40, 0.30 and 0.30. The estimated profit or loss three commodities in respect of these different kinds of monsoon are:

Profit per 1 ton			
Monsoon	Excess	Normal	Deficient
Rice	10,000	-4,000	15,000
Wheat	4,000	-3,000	8,000
Maize	4,000	1,000	-1,000

Determine the optimal decision under each of the following decision criteria and show how you arrived at it:

(a) Optimistic, (b) Pessimistic, (c) Savage criterion, (d) Laplace, (e) Hurwicz Alpha criterion $\alpha=0.8$, (f) Expected payoff criterion (EMV), (g) Expected opportunity loss criterion EOL, (h) Most likelihood ML, EVPI

➤ Decision making under uncertainty.

1. Maximax criterion (OPTIMISM)

Alternative \ Monsoon	Rice	Wheat	Maize
Excess	10,000	4,000	4,000
Normal	-4,000	-3,000	1,000
Deficient	15,000	8,000	-1,000
MAX	15,000	8,000	4,000

The maximum of column maxima is 15,000. Hence, the company should adopt Rice commodity.

2. Maximin criterion (pessimism).

Alternative \ Monsoon	Rice	Wheat	Maize
Excess	10,000	4,000	4,000
Normal	-4,000	-3,000	1,000
Deficient	15,000	8,000	-1,000
Min	-4,000	-3,000	-1,000

The maximum of column minima is -1,000. Hence, the company should adopt Maize commodity.

3. Savage criterion (Minimax)

Alternative Monsoon	Rice	Wheat	Maize
Excess	10,000	4,000	4,000
Normal	-4,000	-3,000	1,000
Deficient	15,000	8,000	-1,000

Note: From the given payoff matrix, develop an opportunity-loss (or regret) matrix as follows:

- Find the best payoff corresponding to each state of nature
- Subtract all other payoff values in that row from this value.

Opportunity Loss Table

Alternative Monsoon	Rice	Wheat	Maize
Excess	10,000-10,000= 0	10,000-4,000= 6,000	10,000-4,000= 6,000
Normal	1,000-(-4,000)= 5,000	1,000-(-3,000) = 4,000	1,000-1,000= 0
Deficient	15,000-15,000= 0	15,000-8,000 = 7,000	15,000-(-1,000)= 16,000
MAX	5,000	7,000	16,000

Decision: Rice

4. Laplace (Equal Probability)

Alternative Monsoon	Rice	Wheat	Maize
Excess	10,000	4,000	4,000
Normal	-4,000	-3,000	1,000
Deficient	15,000	8,000	-1,000
Expected (average)	$\frac{1}{3}(10,000 - 4,000 + 15,000)$ = 7000	$\frac{1}{3}(4,000 - 3,000 + 8,000)$ = 3000	$\frac{1}{3}(4,000 - 1,000 + 1,000)$ = 1333.33

Decision: Rice

5. Hurwicz Alpha criterion $\alpha=0.8$.

Alternative Monsoon	Rice	Wheat	Maize
Excess	10,000	4,000	4,000
Normal	-4,000	-3,000	1,000
Deficient	15,000	8,000	-1,000
weighted average: V(ai)	$0.8(15,000)+0.2(-4,000)=$ 11,200	$0.8(8,000)+0.2(-3,000)=$ 5,800	$0.8*4,000+0.2(-1,000)=$ 3000

$$V = \alpha (\text{Maximum in column}) + (1 - \alpha) (\text{Minimum in column})$$

Decision: Rice

➤ Decision making under Risk.

1. Expected payoff criterion (E)

Alternative Monsoon	Rice	Wheat	Maize	probability
Excess	10,000	4,000	4,000	0.4
Normal	-4,000	-3,000	1,000	0.30
Deficient	15,000	8,000	-1,000	0.30
E	$0.4(10,000)+0.3(-4,000)+0.3(15,000)=$ 7300	$0.4(4,000)+0.3(-3,000)+0.3(8,000)=$ 3100	$0.4(4,000)+0.3(-1,000)+0.3(1,000)=$ 1600	

Decision: Rice

2. Expected Opportunity Loss (EOL).
Opportunity Loss Table

Alternative Monsoon	Rice	Wheat	Maize	probability
Excess	0	6,000	6,000	0.4
Normal	5,000	4,000	0	0.30
Deficient	0	7,000	16,000	0.30
EOL	$0.3(5,000)$ =1,500	$0.4(6,000)+0.3(4,000)+0.3(7,000)$ =5,700	$0.4(6,000)+0.3(16,000)$ =7,200	

Decision: Rice

3. Maximum Likelihood (ML).

Alternative Monsoon	Rice	Wheat	Maize	probability
Excess	10,000	4,000	4,000	0.4

The best choice is Rice

4. Expected Value of Perfect Information (EVPI).

Alternative Monsoon	Rice	Wheat	Maize	probability
Excess	10,000	4,000	4,000	0.4
Normal	-4,000	-3,000	1,000	0.30
Deficient	15,000	8,000	-1,000	0.30
E	$0.4(10,000)+0.3(-4,000)+0.3(15,000)=$ 7300	$0.4(4,000)+0.3(-3,000)+0.3(8,000)=$ 3100	$0.4(4,000)+0.3(-1,000)+0.3(1,000)=$ 1600	

$$EVPI = \text{Expected profit with perfect information} - \max(E)$$

$$= \sum_{i=1}^m p_i \max(r_{ij}) - \max EMV ; \quad (i: \text{represent stat of nature})$$

$$EVPI = 10,000(0.4) + 0.3(1,000) + 0.3(15,000) - 7,800 = 8,800 - 7,300 = 1,500$$

Example: The management of a company is faced with the problem of choosing one of three products that it wants to manufacture. The potential demand for each product may turn out to be good, moderate or poor. The probabilities for each of the states of nature were estimated as follows.

Nature of demand			
situation \ product	X	Y	Z
Good	0.70	0.50	0.40
Moderate	0.20	0.30	0.50
Poor	0.10	0.20	0.10

The Estimated profit or loss in Dollar \$ under the three states may be taken as:

situation \ product	X	Y	Z
Good	300,000	600,000	400,000
Moderate	200,000	300,000	100,000
Poor	100,000	200,000	-150,000

Prepare the Expected value table, and advise the management about the choice of product.

Expected payoff			
	X	Y	Z
Good	$3(0.7) = 2.1$	$6(0.5) = 3$	$4(0.4) = 1.6$
Moderate	$2(0.2) = 0.4$	$3(0.3) = 0.9$	$1(0.5) = 0.5$
Poor	$1(0.1) = 0.1$	$2(0.2) = 0.4$	$-1.5(0.1) = -0.15$
E	$2.1 + 0.4 + 0.1 = 2.6$	4.3	1.95

The best Act is Y

Or by use EOL

Opportunity Loss Table			
	X	Y	Z
Good	$6 - 3 = 3$	$6 - 6 = 0$	$6 - 4 = 2$
Moderate	$3 - 2 = 1$	$3 - 3 = 0$	$3 - 1 = 2$
Poor	$2 - 1 = 1$	$2 - 2 = 0$	$2 - (-1.5) = 3.5$

Expected Opportunity Loss			
	X	Y	Z
Good	$3(0.7) = 2.1$	0	$2(0.4) = 0.8$
Moderate	$1(0.2) = 0.2$	0	$2(0.5) = 1$
Poor	$1(0.1) = 0.1$	0	$3.5(0.1) = 0.35$
EOL	$2.1 + 0.2 + 0.1 = 2.4$	0	2.15

The best choice is product Y

H.W

Example 19.2: A food products' company is contemplating the introduction of a revolutionary new product with new packaging or replacing the existing product at much higher price (S1). It may even make a moderate change in the composition of the existing product, with a new packaging at a small increase in price (S2), or may make a small change in the composition of the existing product, backing it with the word 'New' and a negligible increase in price (S3). The three possible states of nature or events are: (i) high increase in sales (N1) with probability **0.3** , (ii) no change in sales (N2) with probability **0.5** and (iii) decrease in sales (N3) with probability **0.2**.

The marketing department of the company worked out the payoffs in terms of yearly net profits for each of the strategies of three events (expected sales). This is represented in the following table:

Strategies	States of Nature		
	N ₁	N ₂	N ₃
S ₁	700,000	300,000	150,000
S ₂	500,000	450,000	0
S ₃	300,000	300,000	300,000

Which strategy should the concerned executive choose on the basis of

- Pessimism criterion. (Maximin)
- Optimism criterion. (Maximax)
- Salvage or Regret criterion. (Minmax)
- Laplace criterion,
- Hurwicz Alpha criterion $\alpha=0.6$
- Expected Monetary Value (EMV)
- Expected Opportunity Loss (EOL)
- ML
- Expected Value of Perfect Information (EVPI)
