## Exercises chapter 7

### 7.9 Exercises

7.1 The number of deaths from leukemia and other cancers among survivors of the Hiroshima atom bomb are shown in Table 7.12, classified by the radiation dose received. The data refer to deaths during the period 19501959 among survivors who were aged 25 to 64 years in 1950 (from data set 13 of Cox and Snell 1981, attributed to Otake 1979).
(a) Obtain a suitable model to describe the dose-response relationship between radiation and the proportional cancer mortality rates for leukemia.
(b) Examine how well the model describes the data.
(c) Interpret the results.

Table 7.12 Deaths from leukemia and other cancers classified by radiation dose received from the Hiroshima atomic bomb.

|  | Radiation dose (rads) |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Deaths | 0 | $1-9$ | $10-49$ | $50-99$ | $100-199$ | $200+$ |
| Leukemia | 13 | 5 | 5 | 3 | 4 | 18 |
| Other cancers | 378 | 200 | 151 | 47 | 31 | 33 |
| Total cancers | 391 | 205 | 156 | 50 | 35 | 51 |

7.2 Odds ratios. Consider a $2 \times 2$ contingency table from a prospective study in which people who were or were not exposed to some pollutant are followed up and, after several years, categorized according to the presence or absence of a disease. Table 7.13 shows the probabilities for each cell. The odds of disease for either exposure group is $O_{i}=\pi_{i} /\left(1-\pi_{i}\right)$, for
$i=1,2$, and so the odds ratio

$$
\phi=\frac{O_{1}}{O_{2}}=\frac{\pi_{1}\left(1-\pi_{2}\right)}{\pi_{2}\left(1-\pi_{1}\right)}
$$

is a measure of the relative likelihood of disease for the exposed and not exposed groups.

Table $7.132 \times 2$ table for a prospective study of exposure and disease outcome.

|  | Diseased | Not diseased |
| :--- | :---: | :---: |
| Exposed | $\pi_{1}$ | $1-\pi_{1}$ |
| Not exposed | $\pi_{2}$ | $1-\pi_{2}$ |

(a) For the simple logistic model $\pi_{i}=e^{\beta_{i}} /\left(1+e^{\beta_{i}}\right)$, show that if there is no difference between the exposed and not exposed groups (i.e., $\beta_{1}=\beta_{2}$ ), then $\phi=1$.
(b) Consider $J 2 \times 2$ tables like Table 7.13, one for each level $x_{j}$ of a factor, such as age group, with $j=1, \ldots, J$. For the logistic model

$$
\pi_{i j}=\frac{\exp \left(\alpha_{i}+\beta_{i} x_{j}\right)}{1+\exp \left(\alpha_{i}+\beta_{i} x_{j}\right)}, \quad i=1,2, \quad j=1, \ldots, J .
$$

Show that $\log \phi$ is constant over all tables if $\beta_{1}=\beta_{2}$ (McKinlay 1978).
7.3 Tables 7.14 and 7.15 show the survival 50 years after graduation of men and women who graduated each year from 1938 to 1947 from various Faculties of the University of Adelaide (data compiled by J.A. Keats). The columns labelled $S$ contain the number of graduates who survived and the columns labelled $T$ contain the total number of graduates. There were insufficient women graduates from the Faculties of Medicine and Engineering to warrant analysis.
(a) Are the proportions of graduates who survived for 50 years after graduation the same all years of graduation?
(b) Are the proportions of male graduates who survived for 50 years after graduation the same for all Faculties?
(c) Are the proportions of female graduates who survived for 50 years after graduation the same for Arts and Science?
(d) Is the difference between men and women in the proportion of graduates who survived for 50 years after graduation the same for Arts and Science?
7.4 Let $l\left(\mathbf{b}_{\text {min }}\right)$ denote the maximum value of the log-likelihood function for the minimal model with linear predictor $\mathbf{x}^{T} \boldsymbol{\beta}=\beta_{1}$, and let $l(\mathbf{b})$ be the corresponding value for a more general model $\mathbf{x}^{T} \boldsymbol{\beta}=\beta_{1}+\beta_{2} x_{1}+\ldots+$ $\beta_{p} x_{p-1}$.

Table 7.14 Fifty years survival for men after graduation from the University of Adelaide.

| Year of graduation | Faculty |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Medicine |  | Arts |  | Science |  | Engineering |  |
|  | $S$ | $T$ | $S$ | $T$ | $S$ | $T$ | $S$ | $T$ |
| 1938 | 18 | 22 | 16 | 30 | 9 | 14 | 10 | 16 |
| 1939 | 16 | 23 | 13 | 22 | 9 | 12 | 7 | 11 |
| 1940 | 7 | 17 | 11 | 25 | 12 | 19 | 12 | 15 |
| 1941 | 12 | 25 | 12 | 14 | 12 | 15 | 8 | 9 |
| 1942 | 24 | 50 | 8 | 12 | 20 | 28 | 5 | 7 |
| 1943 | 16 | 21 | 11 | 20 | 16 | 21 | 1 | 2 |
| 1944 | 22 | 32 | 4 | 10 | 25 | 31 | 16 | 22 |
| 1945 | 12 | 14 | 4 | 12 | 32 | 38 | 19 | 25 |
| 1946 | 22 | 34 |  |  | 4 | 5 |  |  |
| 1947 | 28 | 37 | 13 | 23 | 25 | 31 | 25 | 35 |
| Total | 177 | 275 | 92 | 168 | 164 | 214 | 100 | 139 |

Table 7.15 Fifty years survival for women after graduation from the University of Adelaide.

| Year | Faculty |  |  |  |
| :---: | ---: | ---: | ---: | ---: |
| of | Arts |  | Science |  |
| graduation | $S$ | $T$ | $S$ | $T$ |
| 1938 | 14 | 19 | 1 | 1 |
| 1939 | 11 | 16 | 4 | 4 |
| 1940 | 15 | 18 | 6 | 7 |
| 1941 | 15 | 21 | 3 | 3 |
| 1942 | 8 | 9 | 4 | 4 |
| 1943 | 13 | 13 | 8 | 9 |
| 1944 | 18 | 22 | 5 | 5 |
| 1945 | 18 | 22 | 16 | 17 |
| 1946 | 1 | 1 | 1 | 1 |
| 1947 | 13 | 16 | 10 | 10 |
| Total | 126 | 157 | 58 | 61 |

(a) Show that the likelihood ratio chi-squared statistic is

$$
C=2\left[l(\mathbf{b})-l\left(\mathbf{b}_{\min }\right)\right]=D_{0}-D_{1},
$$

where $D_{0}$ is the deviance for the minimal model and $D_{1}$ is the deviance for the more general model.
(b) Deduce that if $\beta_{2}=\ldots=\beta_{p}=0$, then $C$ has the central chi-squared distribution with $(p-1)$ degrees of freedom.
