

Answer only three questions (including Q3) from the following questions:

Q1: [4+4]

(a) The probability of the thrower winning in the dice game is $p=0.5071$. Suppose player A is the thrower and begins the game with \$5, and player B, his opponent, begins with \$10. What is the probability that player A goes bankrupt before player B? Assume that the bet is \$1 per round.

(b) Let us model the daily stock price change as $Z = \xi_0 + \xi_1 + \dots + \xi_N$, where

$\xi_0, \xi_1, \dots, \xi_N$ are independent normally distributed random variables with common mean zero and variance 0.5, and N is the number of transactions during the day which has a Poisson distribution with mean 1.

(i) Determine the mean and variance of Z .

(ii) What is the distribution of Z ?

Q2: [4+4]

(a) For the Markov process $\{X_t\}$, $t=0,1,2,\dots,n$ with states $i_0, i_1, i_2, \dots, i_{n-1}, i_n$

Prove that: $\Pr\{X_0 = i_0, X_1 = i_1, X_2 = i_2, \dots, X_n = i_n\} = p_{i_0} P_{i_0 i_1} P_{i_1 i_2} \dots P_{i_{n-1} i_n}$ where $p_{i_0} = \Pr\{X_0 = i_0\}$

(b) A Markov chain X_0, X_1, X_2, \dots has the transition probability matrix

$$\mathbf{P} = \begin{matrix} & \begin{matrix} 0 & 1 & 2 \end{matrix} \\ \begin{matrix} 0 \\ 1 \\ 2 \end{matrix} & \left\| \begin{matrix} 0.2 & 0.3 & 0.5 \\ 0.4 & 0.2 & 0.4 \\ 0.5 & 0.3 & 0.2 \end{matrix} \right\| \end{matrix}$$

and initial distribution $p_0=0.3$, $p_1=0.5$ and $p_2=0.2$ Determine the probabilities

$\Pr\{X_0 = 1, X_1 = 1, X_2 = 0\}$ and $\Pr\{X_1 = 1, X_2 = 1, X_3 = 0\}$

Q3: [5+4]

(a) Consider the Markov chain whose transition probability matrix is given by

$$\mathbf{P} = \begin{matrix} & \begin{matrix} 0 & 1 & 2 & 3 \end{matrix} \\ \begin{matrix} 0 \\ 1 \\ 2 \\ 3 \end{matrix} & \begin{vmatrix} 1 & 0 & 0 & 0 \\ 0.1 & 0.6 & 0.1 & 0.2 \\ 0.2 & 0.3 & 0.4 & 0.1 \\ 0 & 0 & 0 & 1 \end{vmatrix} \end{matrix}$$

- (i) Starting in state 2, determine the probability that the Markov chain ends in state 0.
 - (ii) Determine the mean time to absorption.
 - (iii) Sketch, the Markov chain diagram, and determine whether it's an absorbing chain or not.
- (b) For modelling weather phenomenon, let $\{X_n\}$ be a Markov chain with state space $S = \{1, 2\}$ where 1 stands for rainy and 2 stands for dry. The transition probability matrix is given by

$$\mathbf{P} = \begin{matrix} & \begin{matrix} 1 & 2 \end{matrix} \\ \begin{matrix} 1 \\ 2 \end{matrix} & \begin{vmatrix} 0.8 & 0.2 \\ 0.4 & 0.6 \end{vmatrix} \end{matrix}$$

Initially, assume that the probability of weather will be rainy on 1st June equals 3/8.

Find the probability for each of the following:

- (i) The weather will be rainy on 2nd June.
- (ii) The weather will be rainy on 3rd June.
- (iii) The weather will be dry on 5th June.

Q4: [4+4]

- (a) Let U_1, U_2, \dots, U_n be independent random variables each uniformly distributed over the interval (0,1]. Show that $X_0 = 1$ and $X_n = 2^n U_1 U_2 \dots U_n$, for $n=1,2,\dots$ defines a martingale.
 - (b) Let S_1, S_2, \dots, S_n be independent random variables such that $E|S_i| < \infty$ for all $i=1,2,\dots,n$. Let $X_0 = 0$, $X_n = S_1 + S_2 + \dots + S_n$, $n \geq 1$.
- Prove that: X_n is a martingale if and only if $E[S_n] = 0$ for all $n \geq 1$.

The Model Answer

Q1: [4+4]

(a)

The fortune for player A is $i = \$5$ and the total amount is $N = \$5 + \$10 = \$15$

$$p = 0.5071 \Rightarrow q = 0.4929$$

$$u_i = pr\{X_n \text{ reaches state 0 before state } N \mid X_0 = i\}$$

$$u_i = \frac{(q/p)^i - (q/p)^N}{1 - (q/p)^N}, \quad p \neq q$$

$$\therefore u_i = \frac{(0.4929/0.5071)^5 - (0.4929/0.5071)^{15}}{1 - (0.4929/0.5071)^{15}}$$

$$u_i = 0.61837$$

(b)

$$E(\xi_k) = \mu = 0, \quad \text{Var}(\xi_k) = \sigma^2 = 0.5$$

$$E(N) = v = 1, \quad \text{Var}(N) = \tau^2 = 1$$

$$\therefore Z = \xi_0 + \xi_1 + \dots + \xi_N$$

$$\therefore E(Z) = \mu(v+1) = 0(2) = 0 \text{ and}$$

$$\text{Var}(Z) = (v+1)\sigma^2 + \mu^2\tau^2 = 2(0.5) = 1$$

$$\Rightarrow Z \sim N(0,1)$$

$\therefore Z$ has the standard normal distribution.

Q2: [4+4]

(a)

$$\begin{aligned} & \because \Pr\{X_0 = i_0, X_1 = i_1, X_2 = i_2, \dots, X_n = i_n\} \\ &= \Pr\{X_0 = i_0, X_1 = i_1, X_2 = i_2, \dots, X_{n-1} = i_{n-1}\} \cdot \Pr\{X_n = i_n | X_0 = i_0, X_1 = i_1, X_2 = i_2, \dots, X_{n-1} = i_{n-1}\} \\ &= \Pr\{X_0 = i_0, X_1 = i_1, X_2 = i_2, \dots, X_{n-1} = i_{n-1}\} \cdot P_{i_{n-1}i_n} \quad \text{Definition of Markov} \end{aligned}$$

By repeating this argument $n-1$ times

$$\begin{aligned} & \therefore \Pr\{X_0 = i_0, X_1 = i_1, X_2 = i_2, \dots, X_n = i_n\} \\ &= p_{i_0} P_{i_0i_1} P_{i_1i_2} \dots P_{i_{n-2}i_{n-1}} P_{i_{n-1}i_n} \quad \text{where } p_{i_0} = \Pr\{X_0 = i_0\} \text{ is obtained from the initial distribution of the process.} \end{aligned}$$

(b)

$$\begin{aligned} \text{i) } \Pr\{X_0 = 1, X_1 = 1, X_2 = 0\} &= p_1 P_{11} P_{10}, \quad p_1 = \Pr\{X_0 = 1\} \\ &= 0.5(0.2)(0.4) \\ &= 0.04 \end{aligned}$$

$$\begin{aligned} \text{ii) } \Pr\{X_1 = 1, X_2 = 1, X_3 = 0\} &= p_1 P_{11} P_{10}, \quad p_1 = \Pr\{X_1 = 1\} \\ \Pr\{X_1 = 1\} &= \Pr(X_1 = 1 | X_0 = 0) \Pr(X_0 = 0) + \Pr(X_1 = 1 | X_0 = 1) \Pr(X_0 = 1) + \Pr(X_1 = 1 | X_0 = 2) \Pr(X_0 = 2) \\ &= P_{01} P_0 + P_{11} P_1 + P_{21} P_2 \\ &= 0.3(0.3) + 0.2(0.5) + 0.3(0.2) = 0.25 \end{aligned}$$

$$\therefore \Pr\{X_1 = 1, X_2 = 1, X_3 = 0\} = 0.25(0.2)(0.4) = 0.02$$

Q3: [5+4]

(a)

$$P = \begin{matrix} & \begin{matrix} 0 & 1 & 2 & 3 \end{matrix} \\ \begin{matrix} 0 \\ 1 \\ 2 \\ 3 \end{matrix} & \left\| \begin{matrix} 1 & 0 & 0 & 0 \\ 0.1 & 0.6 & 0.1 & 0.2 \\ 0.2 & 0.3 & 0.4 & 0.1 \\ 0 & 0 & 0 & 1 \end{matrix} \right\| \end{matrix}$$

$$u_i = \Pr\{X_T = 0 | X_0 = i\} \quad \text{for } i=1,2,$$

$$\text{and } v_i = E[T | X_0 = i] \quad \text{for } i=1,2.$$

(i)

$$u_1 = p_{10} + p_{11}u_1 + p_{12}u_2$$

$$u_2 = p_{20} + p_{21}u_1 + p_{22}u_2$$

\Rightarrow

$$u_1 = 0.1 + 0.6u_1 + 0.1u_2$$

$$u_2 = 0.2 + 0.3u_1 + 0.4u_2$$

\Rightarrow

$$4u_1 - u_2 = 1 \quad (1)$$

$$3u_1 - 6u_2 = -2 \quad (2)$$

Solving (1) and (2), we get

$$u_1 = \frac{8}{21} \text{ and } u_2 = \frac{11}{21}$$

Starting in state 2, the probability that the Markov chain ends in state 0 is

$$u_2 = u_{20} = \frac{11}{21} \\ \approx 0.52$$

(ii) Also, the mean time to absorption can be found as follows

$$v_1 = 1 + p_{11}v_1 + p_{12}v_2$$

$$v_2 = 1 + p_{21}v_1 + p_{22}v_2$$

\Rightarrow

$$v_1 = 1 + 0.6v_1 + 0.1v_2$$

$$v_2 = 1 + 0.3v_1 + 0.4v_2$$

\Rightarrow

$$4v_1 - v_2 = 10 \quad (1)$$

$$3v_1 - 6v_2 = -10 \quad (2)$$

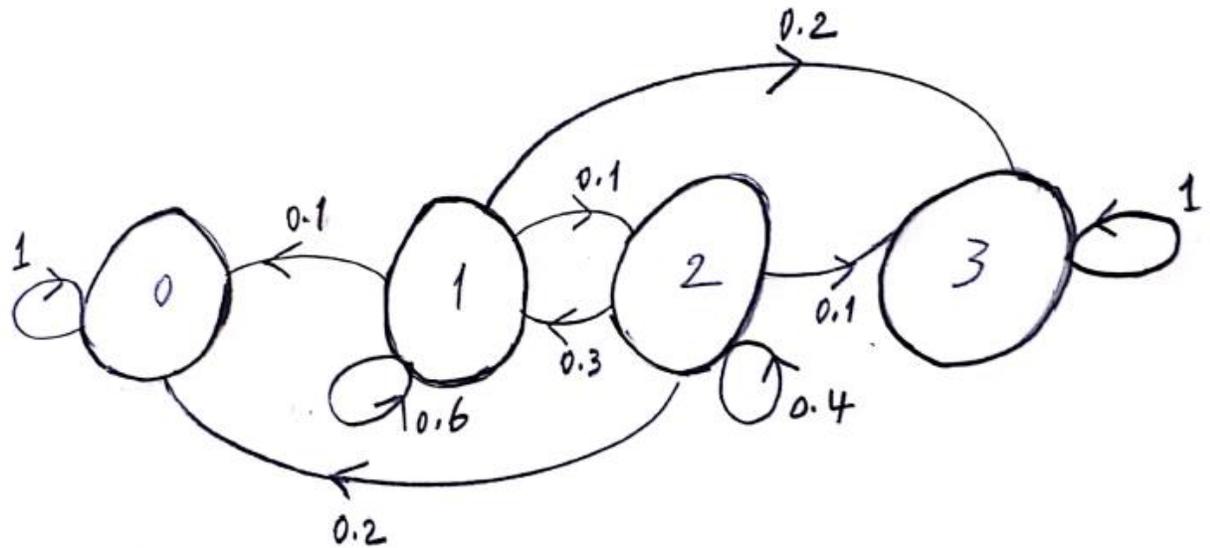

Solving (1) and (2), we get

\therefore The mean time to absorption is

$$v_1 = v_2 = \frac{10}{3}$$

$$\therefore v_2 = v_{20} = \frac{10}{3} \\ \approx 3.3$$

(iii) It's an absorbing Markov Chain.

Markov Chain Diagram

(b)

The Markov chain X_0, X_1, X_2, \dots represents the day's weather

$$\therefore \Pr(X_0 = 1) = p_1 = 3/8$$

$$\therefore \Pr(X_0 = 2) = p_2 = 5/8$$

\Rightarrow The initial probability distribution is $[3/8 \quad 5/8]$

(i) To get the prob. of weather will be rainy on 2nd June

$$\therefore \mathbf{P} = \begin{matrix} & \begin{matrix} 1 & 2 \end{matrix} \\ \begin{matrix} 1 \\ 2 \end{matrix} & \begin{vmatrix} 0.8 & 0.2 \\ 0.4 & 0.6 \end{vmatrix} \end{matrix}$$

$$\begin{aligned} \Pr(X_1 = 1) &= \Pr(X_1 = 1 | X_0 = 1) \Pr(X_0 = 1) + \Pr(X_1 = 1 | X_0 = 2) \Pr(X_0 = 2) \\ &= P_{11}p_1 + P_{21}p_2 \\ &= (0.8)\left(\frac{3}{8}\right) + (0.4)\left(\frac{5}{8}\right) \end{aligned}$$

$$\therefore \Pr(X_1 = 1) = 0.55$$

(ii) To get the prob. of weather will be rainy on 3rd June

$$\begin{aligned} \therefore \mathbf{P}^2 &= \begin{bmatrix} 0.8 & 0.2 \\ 0.4 & 0.6 \end{bmatrix} \begin{bmatrix} 0.8 & 0.2 \\ 0.4 & 0.6 \end{bmatrix} \\ &= \begin{bmatrix} 0.72 & 0.28 \\ 0.56 & 0.44 \end{bmatrix} \end{aligned}$$

$$\begin{aligned} pr(X_2 = 1) &= \Pr(X_2 = 1 | X_0 = 1) \Pr(X_0 = 1) + \Pr(X_2 = 1 | X_0 = 2) \Pr(X_0 = 2) \\ &= P_{11}^2 p_1 + P_{21}^2 p_2 \\ &= (0.72)(3/8) + (0.56)(5/8) \\ \therefore pr(X_2 = 1) &= 0.62 \end{aligned}$$

(iii) To get the prob. of weather will be dry on 5th June

$$\begin{aligned} \therefore \mathbf{P}^4 &= \begin{bmatrix} 0.72 & 0.28 \\ 0.56 & 0.44 \end{bmatrix} \begin{bmatrix} 0.72 & 0.28 \\ 0.56 & 0.44 \end{bmatrix} \\ &= \begin{bmatrix} 0.6752 & 0.3248 \\ 0.6496 & 0.3504 \end{bmatrix} \end{aligned}$$

$$\begin{aligned} pr(X_4 = 2) &= \Pr(X_4 = 2 | X_0 = 1) \Pr(X_0 = 1) + \Pr(X_4 = 2 | X_0 = 2) \Pr(X_0 = 2) \\ &= P_{12}^4 p_1 + P_{22}^4 p_2 \\ &= (0.3248)(3/8) + (0.3504)(5/8) \\ \therefore pr(X_4 = 2) &= 0.3408 \end{aligned}$$

Q4: [4+4]

(a)

1- As X_n is a non-negative random variable,

$$\begin{aligned} E[|X_n|] &= E[X_n] = E[2^n U_1 U_2 \dots U_n] = 2^n E[U_1] \dots E[U_n] \\ &= 2^n \cdot \left(\frac{1}{2}\right)^n = 1 < \infty. \end{aligned}$$

This is because U_i 's are independent, also, since $U_i \sim \text{uniform}(0,1]$, then $E[U_i] = \frac{1}{2}$.

$$\begin{aligned} 2- E[X_{n+1} | X_0, \dots, X_n] &= E[2^{n+1} U_1 U_2 \dots U_n \cdot U_{n+1} | X_0, \dots, X_n] \\ &= 2^n U_1 U_2 \dots U_n E[2 \cdot U_{n+1} | X_0, \dots, X_n] \\ &= 2^n U_1 U_2 \dots U_n \cdot 2 E[U_{n+1} | X_0, \dots, X_n] \\ &= 2^n U_1 U_2 \dots U_n \cdot 2 E[U_{n+1}] \end{aligned}$$

$$= 2^n U_1 U_2 \dots U_n 2^{\frac{1}{2}} = 2^n U_1 U_2 \dots U_n = X_n.$$

From 1 and 2, we proved that X_n is a martingale.

(b)

For $n \geq 1$,

$$1- E|X_n| = E|S_1 + S_2 + \dots + S_n| \leq E|S_1| + E|S_2| + \dots + E|S_n| < \infty, \text{ since } E|S_i| < \infty \text{ for all } i=1,2,\dots,n.$$

$$\begin{aligned} 2- E[X_{n+1}|X_0, \dots, X_n] &= E[(S_1 + S_2 + \dots + S_n + S_{n+1})|X_0, \dots, X_n] \\ &= (S_1 + S_2 + \dots + S_n) + E[S_{n+1}|X_0, \dots, X_n] \\ &= X_n + E[S_{n+1}] \\ &= X_n \text{ if and only if } E[S_{n+1}] = 0. \end{aligned}$$

Therefore, X_n is a martingale if and only if $E[S_n] = 0$ for all $n \geq 1$.
