Answer the following questions.

Q1: [3]

An observation is made of a Poisson random variable N with parameter λ . Then N independent Bernoulli trials are performed, each with probability p of success. Let Z be the total number of successes observed in the N trials. Formulate Z as a random sum and determine its mean and variance. What is the distribution of Z ?

Q2: [1+3]

(a) Define a martingale.

(b) Let U_1, U_2, \dots be independent identically random variables each uniformly distributed over the interval $(0,1]$. Show that $X_0 = 1$ and $X_n = 2^n U_1 \dots U_n$ for $n = 1, 2, \dots$ defines a martingale.

Q3: [3]

Consider a sequence of items from a production process, with each item being graded as good or defective. Suppose that a defective item is followed by another defective item with probability β and is followed by a good item with probability $1 - \beta$. If the first item is defective, what is the probability that the first good item to appear is the fifth item?

The Model Answer

Q1: [3]

Let $Z = \xi_1 + \xi_2 + \dots + \xi_N$, $N > 0$ Then

$$E(\xi_k) = \mu = p, \quad \text{Var}(\xi_k) = \sigma^2 = p(1-p)$$

$$E(N) = v = \lambda, \quad \text{Var}(N) = \tau^2 = \lambda$$

$$\therefore E(Z) = \mu v$$

$$\therefore E(Z) = \lambda p$$

$$\therefore \text{Var}(Z) = v\sigma^2 + \mu^2\tau^2$$

$$\begin{aligned} \therefore \text{Var}(Z) &= \lambda p(1-p) + p^2\lambda \\ &= \lambda p \end{aligned}$$

Consequently, $Z \sim \text{Poisson}(\lambda p)$.

Q2: [1+3]

(a)

A stochastic process $\{X_n; n = 0, 1, 2, \dots\}$ is a martingale if for $n = 0, 1, 2, \dots$

$$(i) \quad E[|X_n|] < \infty,$$

$$(ii) \quad E[X_{n+1} | X_0, \dots, X_n] = X_n.$$

(b)

(1) To show that $E[|X_n|] < \infty$,

$$\begin{aligned} \therefore E[|X_n|] &= E[X_n] \\ &= E[2^n U_1 \dots U_n] \\ &= 2^n E[U_1][U_2] \dots [U_n] \text{ as } U_{i's} \text{ are indep. r.v.s} \end{aligned}$$

$$\therefore E[|X_n|] = 2^n \cdot \frac{1}{2} \cdot \frac{1}{2} \dots \frac{1}{2} = \frac{2^n}{2^n} = 1 < \infty$$

(2) To show that $E[X_{n+1} | X_0, \dots, X_n] = X_n$,

$$\begin{aligned} \therefore E[X_{n+1} | X_0, \dots, X_n] &= E[2^{n+1} U_1 \dots U_n U_{n+1} | X_0, \dots, X_n] \\ &= 2^n U_1 \dots U_n E[2U_{n+1} | X_0, \dots, X_n], \text{ as } U_1 \dots U_n \text{ is determined by } X_{i's} \\ &= 2^n U_1 \dots U_n \cdot 2E[U_{n+1}], \text{ as } U_{n+1} \text{ is indep. of } X_{i's} \\ &= 2^n U_1 \dots U_n \cdot 2 \cdot \frac{1}{2} \text{ where } E[U_i] = \frac{1}{2}, i = 1, 2, \dots \end{aligned}$$

$$\therefore E[X_{n+1} | X_0, \dots, X_n] = X_n$$

That is from (1) and (2), we have proved that X_n , $n = 0, 1, 2, \dots$ where $X_0 = 1$ is a martingale.

Q3: [3]

$$\begin{aligned} & \Pr\{X_2 = D, X_3 = D, X_4 = D, X_5 = G | X_1 = D\} \\ &= \Pr\{X_5 = G, X_4 = D, X_3 = D, X_2 = D | X_1 = D\} \\ &= \Pr\{X_5 = G | X_4 = D\} \cdot \Pr\{X_4 = D | X_3 = D\} \cdot \Pr\{X_3 = D | X_2 = D\} \cdot \Pr\{X_2 = D | X_1 = D\} \\ &= p_{DG} p_{DD}^3 \\ &= (1 - \beta) \beta^3 \\ &= \beta^3 (1 - \beta) \end{aligned}$$

Also, you can solve it as follows.

$$\begin{aligned} & p_1 p_{12} p_{23} p_{34} p_{45}, p_1 = \Pr(X_1 = D) = 1 \\ &= p_D p_{DD}^3 p_{DG}, p_D = 1 \\ &= \beta^3 (1 - \beta) \end{aligned}$$
