

## Chapter # 2 Part # 2

1 ) How many truck loads of truck hauling an average volume of 6 LCY would be required to haul 1 million CCY of problem #4 in tutorial sheet #1?

Solution:

$$\text{Load factor} = 80.6\% \approx 0.8$$

$$\text{Shrinkage factor} = 84.9\% \approx .85$$

$$\text{Bank volume} = \frac{\text{Compacted volume}}{\text{Shrinkage factor}} = \frac{1,000,000 \text{ CCY}}{0.85} = 1,176,470.6 \text{ BCY}$$

$$\text{Loose volume} = \frac{\text{Bank volume}}{\text{Load factor}} = \frac{1,176,470.6 \text{ BCY}}{0.8} = 1,470,588.2 \text{ LCY}$$

$$\text{Number of trucks} = \frac{\text{Loose volume}}{\text{Truck capacity}} = \frac{1,470,588.2 \text{ LCY}}{6 \text{ LCY/truck}} = 245,098 \text{ Truck}$$

2) Calculate the volume of excavation in bank measure required for the basement shown.

Solution:

$$\text{Average depth of first part} = \frac{6.6 + 6 + 6.9 + \frac{8.2 + 6.6}{2}}{4} = 6.725 \text{ ft}$$

$$\text{Area of the first part} = 24 \times 28 = 672 \text{ ft}^2$$

$$\text{Volume of excavation of the first part} = \text{area} \times \text{depth} = 672 \times 6.725 = 4519.2 \text{ BCf}$$

$$\text{Average depth of second part} = \frac{7.4 + 6.8 + 8.2 + \frac{8.2 + 6.6}{2}}{4} = 7.45 \text{ ft}$$

$$\text{Area of the second part} = 45 \times 26 = 1170 \text{ ft}^2$$

$$\text{Volume of excavation of the second part} = \text{area} \times \text{depth} = 1170 \times 7.45 = 8716.5 \text{ BCf}$$

$$\text{Total volume of excavation} = 4519.2 + 8716.5 = 13235.7 \text{ BCf}$$
