## Discounted Cash Flow Formulas

## Discounted Cash Flow Formulas

$F=P(1+i)^{n}$
$F=P(F \mid P, n)$
single sum, future worth factor
$P=F(1+i)^{-n}$
$P=F(P \mid F i \%, n)$
single sum, present worth factor

## Computing the Present Worth of Multiple Cash flows

$$
\begin{align*}
& P=\sum_{t=0}^{n} A_{t}(1+i)^{-t}  \tag{2.12}\\
& P=\sum_{t=0}^{n} A_{t}(P \mid F i \%, t) \tag{2.13}
\end{align*}
$$

## Computing the Future worth of Multiple cash Flows

$$
\begin{align*}
& F=\sum_{t=1}^{n} A_{t}(1+i)^{n-t}  \tag{2.15}\\
& F=\sum_{t=1}^{n} A_{t}(F \mid P \quad i \%, n-t)
\end{align*}
$$

(2.16)

## DCF Uniform Series Formulas

P occurs 1 period before first A

$$
\begin{aligned}
& P=A\left[\frac{(1+i)^{n}-1}{i(1+i)^{n}}\right] \\
& \text { uniform series, present worth factor } \\
& =A(P \mid A i \%, n)=P V(i \%, n,-A) \\
& A=P\left[\frac{i(1+i)^{n}}{(1+i)^{n}-1}\right] \\
& \text { uniform series, capital recovery factor } \\
& =P(A \mid P \%, n)=\operatorname{PMT}(\%, n,-P) \\
& F=A\left[\frac{(1+i)^{n}-1}{i}\right] \\
& \text { uniform series, future worth factor } \\
& =A(F \mid A \%, n)=F V(i \%, n,-A) \\
& \text { to fund a future capital expense } \\
& A=F\left[\frac{i}{(1+i)^{n}-1}\right] \\
& \text { uniform series, sinking fund factor } \\
& =F(A \mid F i \%, n)=\operatorname{PMT}(i \%, n,,-F)
\end{aligned}
$$

## Gradient Series

$$
\begin{aligned}
& A_{t}= \begin{cases}0 & t=1 \\
A_{t-1}+G & t=2, \ldots, n\end{cases} \\
& \text { or } \\
& t=1, \ldots, n
\end{aligned}
$$

Start fr $\mathrm{n}=2$
( $\mathrm{n}-1$ ) G Note: $\mathrm{n}-1$, not n

## Converting Gradient Series

Converting gradient series to present worth

$$
\begin{align*}
& \mathrm{P}=\mathrm{G}\left[\frac{1-(1+n i)(1+i)^{-n}}{i^{2}}\right]  \tag{2.35}\\
& \mathrm{P}=\mathrm{G}\left[\frac{(P \mid A i \%, n)-n(P \mid F i \%, n)}{i}\right]  \tag{2.36}\\
& \mathrm{P}=\mathrm{G}(\mathrm{P} \mid \mathrm{G} i \%, \mathrm{n}) \tag{.37}
\end{align*}
$$

## Converting Gradient Series - II

Converting gradient series to annual worth

$$
\begin{align*}
& \mathrm{A}=\mathrm{G}\left[\frac{1}{i}-\frac{n}{(1+i)^{n}-1}\right] \\
& \mathrm{A}=\mathrm{G}\left[\frac{1-n(A \mid F i \%, n)}{i}\right] \\
& \mathrm{A}=\mathrm{G}(\mathrm{~A} \mid \mathrm{G} i \%, \mathrm{n}) \tag{2.38}
\end{align*}
$$

## Converting Gradient Series - III

Converting gradient series to future worth

$$
\begin{align*}
& \mathrm{F}=\mathrm{G}\left[\frac{(1+i)^{n}-(1+n i)}{i^{2}}\right]  \tag{2.39}\\
& \mathrm{F}=\mathrm{G}\left[\frac{(F \mid A i \%, n)-n}{i}\right] \\
& \mathrm{F}=\mathrm{G}(\mathrm{~F} \mid \mathrm{G} \mathrm{i} \%, \mathrm{n}) \quad \text { (not provided in the tables) }
\end{align*}
$$

## Example 2.28

Maintenance costs for a particular production machine increase by $\$ 1,000 /$ year over the 5 -yr life of the machine. The initial maintenance cost is $\$ 3,000$. Using an interest rate of $8 \%$ compounded annually, determine the present worth equivalent for the maintenance costs.

Composite series

Increasing gradient

## Example 2.28

Maintenance costs for a particular production machine increase by $\$ 1,000 /$ year over the 5 -yr life of the machine. The initial maintenance cost is $\$ 3,000$. Using an interest rate of $8 \%$ compounded annually, determine the present worth equivalent for the maintenance costs. ${ }^{\mathrm{n}}$ in uniform series $=$

$$
\begin{aligned}
& \mathrm{P}=\$ 3,000(\mathrm{P} \mid \mathrm{A} 8 \%, 5)+\$ 1,000(\mathrm{P} \mid \mathrm{G} 8 \%, 5) \\
& \mathrm{P}=\$ 3,000(3.99271)+\$ 1,000(7.372 .43)=\$ 19,350.56
\end{aligned}
$$

OR

> Convert all CF to uniform payments then convert it using single sum to PW

$$
\begin{aligned}
& \mathrm{P}=(\$ 3,000+\$ 1,000(\mathrm{~A} \mid \mathrm{G} 8 \%, 5))(\mathrm{P} \mid \mathrm{A} 8 \%, 5) \\
& \mathrm{P}=(\$ 3,000+\$ 1,000(1.846 .47))(3.99271)=\$ 19,350.55 \text { or } \\
& \mathrm{P}=1000 * \mathrm{NPV}(8 \%, 3,4,5,6,7)=\$ 19,350.56
\end{aligned}
$$

Principles of Engineering Economic Analysis, 5th edition

## Example 2.29

Amanda Dearman made 5 annual deposits into a fund that paid $8 \%$ compound annual interest. Her first deposit was $\$ 800$; each successive deposit was $\$ 100$ less than the previous deposit. How much was in the fund immediately after the 5 th deposit?

Decreasing gradient
To apply Gradient rule first G should begin fr second year

## Example 2.29

## Example 2.29

Amanda Dearman made 5 annual deposits into a fund that paid 8\% compound annual interest. Her first deposit was $\$ 800$; each successive deposit was $\$ 100$ less than the previous deposit. How much was in the fund immediately after the 5th deposit?
$\mathrm{A}=\$ 800-\$ 100(\mathrm{~A} \mid \mathrm{G} 8 \%, 5)=\$ 800-\$ 100(1.84647)=\$ 615.35$
$\mathrm{F}=\$ 615.35(\mathrm{~F} \mid \mathrm{A} 8 \%, 5)=\$ 615.35(5.86660)=\$ 3,610.01$

Convert all CF to uniform payments then convert it using single sum to FW

But why not to use F= 800 (F/A 8\%,5)-100 (F/G 8\%,5)

## Example 2.29

Amanda Dearman made 5 annual deposits into a fund that paid $8 \%$ compound annual interest. Her first deposit was $\$ 800$; each successive deposit was $\$ 100$ less than the previous deposit. How much was in the fund immediately after the 5th deposit?

$$
\begin{aligned}
& \mathrm{A}=\$ 800-\$ 100(\mathrm{~A} \mid \mathrm{G} 8 \%, 5)=\$ 800-\$ 100(1.84647)=\$ 615.35 \\
& \mathrm{~F}=\$ 615.35(\mathrm{~F} \mid \mathrm{A} 8 \%, 5)=\$ 615.35(5.86660)=\$ 3,6101.01 \\
& \mathrm{~F}=(\mathrm{FV}(8 \%, 5,, \mathrm{NPV}(8 \%, 800,700,600,500,400)) \\
& \mathrm{F}=\$ 3,610.03 \text { (Using excel worksheet) }
\end{aligned}

## Geometric Series

$$
\mathbf{A}_{\mathbf{t}}=\mathbf{A}_{\mathbf{t}-1}(1+\mathbf{j}) \quad \mathbf{t}=\mathbf{2}, \ldots, \mathbf{n} \quad \mathrm{n} \text { in Geometric series }=\text { number of payments }
$$

or
First payment unlike the gradient series

$$
A_{t}=A_{1}(1+j)^{t-1} \quad t=1, \ldots, n
$$

$\mathrm{A}_{1}(1+\mathrm{j})^{\mathrm{n}-1}$ Note: $\mathrm{n}-1$ not n

## Converting Geometric Series - I

Converting a geometric series to a present worth

$$
\begin{align*}
& P=A_{1}\left[\frac{1-(1+j)^{n}(1+i)^{-n}}{i-j}\right] \quad i \neq j  \tag{2.42}\\
& P=n A_{1} /(1+i) \quad i=j \tag{2.42}
\end{align*}
$$

$$
\begin{equation*}
P=A_{1}\left(P \mid A_{1} i \%, j \%, n\right) \tag{2.44}
\end{equation*}
$$

$$
\begin{equation*}
P=A_{1}\left[\frac{1-(F \mid P j \%, n)(P \mid F i \%, n)}{i-j}\right] \quad i \neq j \quad j>0 \tag{2.43}
\end{equation*}
$$

## Converting Geometric Series - II

Converting a geometric series to a future worth

$$
F=A_{1}\left[\frac{(1+i)^{n}-(1+j)^{n}}{i-j}\right] \quad i \neq j
$$

$$
F=n A_{1}(1+i)^{n-1} \quad i=j
$$

$$
F=A_{1}\left[\frac{(F \mid P i \%, n)-(F \mid P j \%, n)}{i-j}\right] \quad i \neq j \quad j>0
$$

$$
F=A_{1}\left(F \mid A_{1} i \%, j \%, n\right)
$$

Note: $\left(F \mid A_{1} i \%, j \%, n\right)=\left(F \mid A_{1} j \%, i \%, n\right)$ Notice the symmetry

## Example 2.30

A firm is considering purchasing a new machine. It will have maintenance costs that increase 8\% per year. An initial maintenance cost of $\$ 1,000$ is expected. Using a $10 \%$ interest rate, what present worth cost is equivalent to the cash flows for maintenance of the machine over its 15 -year expected life?

## Example 2.30

A firm is considering purchasing a new machine. It will have maintenance costs that increase $8 \%$ per year. An initial maintenance cost of $\$ 1,000$ is expected. Using a $10 \%$ interest rate, what present worth cost is equivalent to the cash flows for maintenance of the machine over its 15 -year expected life?
$A_{1}=\$ 1,000, i=10 \%, j=8 \%, n=15, P=?$
$\mathrm{P}=\$ 1,000\left(\mathrm{P} \mid \mathrm{A}_{1} 10 \%, 8 \%, 15\right)=\$ 1,000(12.03040)=\$ 12,030.40$

## Example 2.30
