Introduction to Vector Spaces

Definition

We say that a non empty set $\mathbb E$ is a vector space on $\mathbb R$ if:

- (Closure for the sum operation) $u + v \in \mathbb{E}$, $\forall u, v \in \mathbb{E}$.
- ② (Associativity of the sum operation) u + (v + w) = (u + v) + w, for all $u, v, w ∈ \mathbb{E}$
- (The identity element) There is 0 ∈ E called the identity element of the sum operation such that u + 0 = 0 + u = u, ∀u ∈ E.
- For all u ∈ E, there is v ∈ E such that u + v = v + u = 0. The vector v is called the symmetric of u and written -u.

(Commutativity)
$$u + v = v + u$$
, $\forall u, v \in \mathbb{E}$.

- (The closure of the exterior operation) $\forall a \in \mathbb{R}$ and $u \in \mathbb{E}$, $au \in \mathbb{E}$,
- **2** If $u, v \in \mathbb{E}$ and $a \in \mathbb{R}$, then a(u + v) = au + av.
- $If u \in \mathbb{E} and a, b \in \mathbb{R}, then (a+b)u = au + bu,$
- If $u \in \mathbb{E}$ and $a, b \in \mathbb{R}$, then (a.b)u = a(bu),
- If $u \in \mathbb{E}$, then 1.u = u.

Introduction to Vector Spaces

Vector Sub-Spaces Linear Combination and Generating sets Linear Dependence and Independence Base and Dimension Coordinate System and Change of Basis Rank of Matrix

Examples

- **①** \mathbb{R}^n is a vector space .
- 2 The set $\{(x, y, 2x + 3y); x, y \in \mathbb{R}\}$ is a vector space.
- The set of polynomials $\mathcal{P} = \mathbb{R}[X]$ is a vector space . Also the set of polynomials of degree less then n, $\mathcal{P}_n = \mathbb{R}_n[X]$ is a vector space .

The Vector Sub-Spaces

Definition

Let V be a vector space and F a subset of V. We say that F is a sub-space of V if F is vector space with the same operations of the vector space V.

Theorem

Let V be a vector space and F a subset of V.

F is a sub-space of V if and only if

```
\bullet \ 0 \in F,
```

```
2 If u, v \in F, then u + v \in F,
```

```
3 If u \in F, a \in \mathbb{R}, then au \in F.
```

Examples

• The set
$$F = \{ \begin{pmatrix} a & b \\ 0 & 2a-b \end{pmatrix}$$
; $a, b \in \mathbb{R} \}$ is a sub-space of $V = M_2(\mathbb{R})$.

- Q Let A ∈ M_{m,n}(ℝ) be a matrix and F = {X ∈ ℝⁿ; AX = 0}.
 F is sub-space of V = ℝⁿ. (F is the set of solutions of the homogeneous system AX = 0).
- The set F = {(x, x + 1); x ∈ ℝ} is not a sub-space of ℝ² since (0, 0) ∉ F.

Example

The set $W = \{A \in M_n / A = -A^T\}$ is a sub-space of $M_n(\mathbb{R})$. Indeed: if $A, B \in W$ and $\lambda \in \mathbb{R}$

$$(A+B)^{\mathsf{T}} = A^{\mathsf{T}} + B^{\mathsf{T}} = -A - B$$

and

$$(\lambda A)^T = \lambda A^T = -\lambda A.$$

Then W is a sub-space of M_n .

Example

The set $E = \{(x, y) \in \mathbb{R}^2; xy = 0\}$ is not a sub-space since $(1, 0) \in E$ and $(0, 1) \in E$ but $(1, 0) + (0, 1) = (1, 1) \notin E$.

Definition

Let V be a vector space and let v_1, \ldots, v_n be a finite vectors in V. We say that a vector $w \in V$ is a linear combination of the vectors v_1, \ldots, v_n if there is $x_1, \ldots, x_n \in \mathbb{R}$ such that

$$w = x_1v_1 + \ldots + x_nv_n.$$

Example

The vector (4, 1, 1) is a linear combination of the vectors (1, 0, 2), (2, -1, 3), (0, -1, 1) because

$$(4,1,1) = -2(1,0,2) + 3(2,-1,3) - 4(0,-1,1).$$

Example

The vector (1,1,2) is not a linear combination of the vectors (1,0,2), (0,-1,1) because the linear system (1,1,2) = x(1,0,2) + y(0,-1,1) don't have a solution.

Example

In \mathbb{R}^4 is the vectors (a, 1, b, 1) and (a, 1, 1, b) are linear combination of the vectors $e_1 = (1, 2, 3, 4)$ and $e_2 = (1, -2, 3, -4)$. The vector $(a, 1, b, 1) \in \operatorname{Vect}(e_1, e_2)$ if and only if the linear system AX = B is consistent with $A = \begin{pmatrix} 1 & 1 \\ 2 & -2 \\ 3 & 3 \\ 4 & -4 \end{pmatrix}$ and $B = \begin{pmatrix} a \\ 1 \\ b \\ 1 \end{pmatrix}$. The system is not consistent because the second and the forth equal

The system is not consistent because the second and the forth equations can not be true in the same time. ((2a-2b=1, 4a-4b=1))

The vector
$$(a, 1, 1, b) \in Vect(e_1, e_2)$$
 if and only if the linear system

$$AX = B \text{ is consistent with } A = \begin{pmatrix} 1 & 1 \\ 2 & -2 \\ 3 & 3 \\ 4 & -4 \end{pmatrix} \text{ and } B = \begin{pmatrix} a \\ 1 \\ 1 \\ b \end{pmatrix}.$$

The system has a unique solution and in this case $a = \frac{1}{3}$ and $b = 2$.

Example

Let *E* be the vector sub-space of \mathbb{R}^3 generated by the vectors (2, 3, -1) and (1, -1, -2) and let *F* be the sub-space of \mathbb{R}^3 generated by the vectors (3, 7, 0) and (5, 0, -7). The sub-spaces *E* and *F* are equal.

$$\begin{cases} 2x + y = a \\ 3x - y = b \\ -x - 2y = c \end{cases}$$

This system is equivalent with the following system

$$\begin{cases} x + 2y = -c \\ -3y = a + 2c \\ -7y = b + 3c \end{cases}$$

This system is consistent if and only if 7a - 3b + 5c = 0.

We remark that the vectors (2, 3, -1) and (1, -1, -2) are solutions of the system, then $F \subset E$. With the same method, the vectors (2, 3, -1) and (1, -1, -2) are in the sub-space F. This proves that E = F.

Example

Is there $a, b \in \mathbb{R}$ such that the vector v = (-2, a, b, 5) is in the sub-space of \mathbb{R}^4 generated by the vectors u = (1, -1, 1, 2) and v = (-1, 2, 3, 1).

Solution

The vector v = (-2, a, b, 5) is in the sub-space of \mathbb{R}^4 generated by the vectors u = (1, -1, 1, 2) and v = (-1, 2, 3, 1) if the following linear system is consistent AX = B with $A = \begin{pmatrix} 1 & -1 \\ -1 & 2 \\ 1 & 3 \\ 2 & 1 \end{pmatrix}$ and

$$B = \begin{pmatrix} -2\\ a\\ b\\ 5 \end{pmatrix}.$$

This system is consistent if and only if $3 = a - 2 = \frac{b+2}{4}$. Then a = 5 and b = 10.

Theorem

Let A be the matrix of type
$$(m, n)$$
 and let $X = \begin{pmatrix} x_1 \\ \vdots \end{pmatrix}$ be the

matrix of type (n, 1). If C_1, \ldots, C_n are the columns of the matrix A, then

 (x_n)

$$AX = x_1C_1 + \ldots + x_nC_n.$$

Corollary

Let A be a matrix of type (m, n). The linear system AX = B is consistent if and only if the matrix B is a linear combination of the columns of the matrix A.

Definition

Let $S = \{v_1, \ldots, v_n\}$ be a set of vectors in a vector space V. We say that the vector space V is generated (or spanned) by the set S if any vector in V is a linear combination of the vectors v_1, \ldots, v_n . (We say also that S is a spanning set of V).

Theorem

Let $S = \{v_1, \ldots, v_n\} \subset \mathbb{R}^m$ and A the matrix of type (m, n) with columns v_1, \ldots, v_n . The set S spans the vector space \mathbb{R}^m if and only if the system AX = B is consistent for all $B \in \mathbb{R}^m$.

Example

Determine whether the vectors $v_1 = (1, -1, 4)$, $v_2 = (-2, 1, 3)$, and $v_3 = (4, -3, 5)$ span \mathbb{R}^3 . We solve the following linear system AX = B, where $A = \begin{pmatrix} 1 & -2 & 4 \\ -1 & 1 & -3 \\ 4 & 3 & 5 \end{pmatrix}$, $B = \begin{pmatrix} a \\ b \\ c \end{pmatrix}$ for arbitrary $a, b, c \in \mathbb{R}$.

A reduced of the augmented matrix is given by:

$$\begin{bmatrix} 1 & 0 & 2 & -a-2b \\ 0 & 1 & -1 & -a-b \\ 0 & 0 & 0 & 7a+11b+c \end{bmatrix}$$
.
This system has a solution only when $7a+11b+c=0$. Thus, the vectors do not span \mathbb{R}^3 .

Example

Determine whether the vectors
$$v_1 = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$$
 and $v_2 = \begin{pmatrix} 2 & 1 \\ 0 & 3 \end{pmatrix}$,
span the vector space $F = \{ \begin{pmatrix} a & b \\ 0 & 2a - b \end{pmatrix}; a, b \in \mathbb{R} \}$.
 $\begin{pmatrix} a & b \\ 0 & 2a - b \end{pmatrix} = xv_1 + yv_2 \iff \begin{cases} x + 2y = a \\ x + y = b \\ x + 3y = 2a - b \end{cases}$.
This system has the unique solution $x = 2b - a$ and $y = a - b$.

Theorem

Let $S = \{v_1, \ldots, v_n\}$ be a set of vectors in a vector space V, then

- the set *W* of linear combinations of the vectors of *S* is a linear sub-space in *V*.
- W is the smallest sub-space of V which contains S.
 This sub-space is called the sub-space generated (or spanned) by the set S and denoted by (S) or Vect(S).

Example

Let
$$F = \{ \begin{pmatrix} a & b \\ 0 & 2a - b \end{pmatrix}; a, b \in \mathbb{R} \}.$$

 $\begin{pmatrix} a & b \\ 0 & 2a - b \end{pmatrix} = a \begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix} + b \begin{pmatrix} 0 & 1 \\ 0 & -1 \end{pmatrix}.$ Then F is the sub-space of $V = M_2(\mathbb{R})$ spanned by $\left\{ \begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix}, \begin{pmatrix} 0 & 1 \\ 0 & -1 \end{pmatrix} \right\}.$

Definition

We say that the set of vectors v_1, \ldots, v_n in a vector space V are linearly independent if the equation

$$x_1v_1+\ldots,+x_nv_n=0$$

has 0 as unique solution.

Example

The vectors u = (1, 1, -2), v = (1, -1, 2) and w = (3, 0, 2) are linearly independent in \mathbb{R}^3 .

$$xu + yv + zw = (0, 0, 0) \iff \begin{cases} x + y + 3z = 0\\ x - y = 0\\ -2x + 2y + 2z = 0 \end{cases}$$

Mongi BLEL

The Vector Spaces

This system has 0 as unique solution.

The matrix of this system is

$$\begin{pmatrix} 1 & 1 & 3 \\ 1 & -1 & 0 \\ -2 & 2 & 2 \end{pmatrix}$$
 and its determinant is

-4.

Example

The set of vectors { $P_1 = 1 + x + x^2$, $P_2 = 2 - x + 3x^2$, $P_3 = x - x^2$ } is linearly independent in \mathcal{P}_2 . $aP_1 + bP_2 + cP_3 = 0 \iff (a+2b) + (a-b+c)x + (a+3b-c)x^2 =$ $0 \iff \begin{cases} a+2b = 0\\ a-b+c = 0.\\ a+3b-c = 0 \end{cases}$

Definition

We say that the vectors v_1, \ldots, v_n in a vector space V are linearly dependent if they are not linearly independent.

Example

The vectors
$$u = (0, 1, -2, 1)$$
, $v = (1, 0, 2, -1)$ and $w = (3, 2, 2, -1)$ are linearly dependent in \mathbb{R}^4 .

$$xu + yv + zw = (0, 0, 0, 0) \iff \begin{cases} y + 3z = 0\\ x + 2z = 0\\ -2x + 2y + 2z = 0\\ x - y - z = 0 \end{cases}$$

This system has infinite solutions.

The extended matrix of this system is
$$\begin{bmatrix} 0 & 1 & 3 & | & 0 \\ 1 & 0 & 2 & 0 \\ -2 & 2 & 2 & | & 0 \\ 1 & -1 & -1 & | & 0 \end{bmatrix}$$
 and the reduced row form of this matrix is :
$$\begin{bmatrix} 1 & 0 & 2 & | & 0 \\ 0 & 1 & 3 & 0 \\ 0 & 0 & 0 & | & 0 \\ 0 & 0 & 0 & | & 0 \end{bmatrix}$$
.

Theorem

Let $S = \{v_1, \ldots, v_n\}$ be a set of vectors in a vector space V, with $n \ge 2$.

The set S is linearly dependent if and only if there is a vector of S which is a linear combination of the rest of vectors.

Theorem

Let $S = \{v_1, \ldots, v_n\} \subset \mathbb{R}^m$ and A the matrix of type (m, n) such that its columns are the vectors of S. The set S is linearly independent if and only if the homogeneous

system AX = 0 has 0 as unique solution.

Examples

- If A is a matrix of type (m, n) with m < n. Then the homogeneous system AX = 0 has an infinite solutions.
- ② If $S = \{v_1, ..., v_n\} ⊂ ℝ^m$ with m < n, then the set S is linearly dependent.

Base and Dimension

Definition

Let $S = \{v_1, \ldots, v_n\}$ be a set of vectors in a vector space V. We say that S is a basis of the vector space V if :

- The set S generates the vector space V
- **2** The set S is linearly independent.

Theorem

If $S = \{v_1, \ldots, v_n\}$ is a basis of the vector space V. Any vector $v \in V$ can be written uniquely as a linear combination of vectors in the basis S.

Remark

Let $S = \{e_1, \ldots, e_n\}$ be the set of the vectors in the vector space \mathbb{R}^n , where

$$e_1 = (1, 0, \ldots, 0), \ldots, e_k = (0, \ldots, 0, 1, 0, \ldots, 0), \ldots, e_n = (0, \ldots, 0, 1).$$

The set S is a basis of \mathbb{R}^n and is called the natural basis of \mathbb{R}^n .

Exercise

Prove that $S = \{1, X, ..., X^n\}$ is a basis of the vector space \mathcal{P}_n .

Example

Let
$$v_1 = (\lambda, 1, 1)$$
, $v_2 = (1, \lambda, 1)$ and $v_3 = (1, 1, \lambda)$.

Find the values of $\lambda \in \mathbb{R}$ such that $\{v_1, v_2, v_3\}$ is a basis of the vector space \mathbb{R}^3 .

Solution

The set $\{v_1, v_2, v_3\}$ is linearly independent if 0 the unique solution of the equation

$$xv_1 + yv_2 + zv_3 = 0.$$

This is equivalent that the following matrix has an inverse :

 $\begin{array}{l} A = \begin{pmatrix} \lambda & 1 & 1 \\ 1 & \lambda & 1 \\ 1 & 1 & \lambda \end{pmatrix}. \\ \text{Then } \lambda \not\in \{-2, 1\}. \\ \text{The set } \{v_1, v_2, v_3\} \text{ generates the vector space } \mathbb{R}^n \text{ because the linear system } AX = B \text{ is consistent for all } B \in \mathbb{R}^n \text{ since the matrix } A \text{ has an inverse }. \end{array}$

Theorem

Let $S = \{v_1, \ldots, v_n\}$ be a basis of the vector space V and let $T = \{u_1, \ldots, u_m\}$ be a set of vectors. If m > n, then T is linearly dependent.

Corollary

If $S = \{v_1, \ldots, v_n\}$ and $T = \{u_1, \ldots, u_m\}$ are basis of the vector space V, then m = n.

Mongi BLEL The Vector Spaces

Definition

If $S = \{v_1, \ldots, v_n\}$ is a basis of the vector space V then the number of vectors n of S is called the dimension of the vector space V and denoted by: $\dim V = n$.

Theorem

Let V is a vector space of dimension n. If $S = \{v_1, \ldots, v_n\}$ in V. Then

S is linearly independent if and only if S generates the vector space V and this is equivalent also with S is a basis of V.

Mongi BLEL The Vector Spaces

Theorem

If $S = \{v_1, \ldots, v_n\}$ generates the vector space V, then it contains a basis of the vector space V.

Remark

If $S = \{v_1, \ldots, v_m\} \subset \mathbb{R}^n$ is a set of vectors and F the vector sub-space generated by S. We have the following two algorithms to construct a basis of F.

- O Construct the matrix A such that its rows are the vectors of S
- The non zeros rows of any row echelon form of the matrix A are a basis of the vector space F = (S).

Second Algorithm

- Construct the matrix A such that its columns are the vectors of S
- **2** Take any row echelon form C of the matrix A.
- Let C_{k1},... C_{kp} be the columns which contain a leading number and k₁ < ... < k_p. Then {v_{k1},..., v_{kp}} is a basis of the vector space F = ⟨S⟩.

Theorem

- If S = {v₁,..., v_n} is a set of vectors and generates the vector space V, then S contains a basis of the vector space V.
- If S = {v₁,..., v_n} is a set of linearly independent vectors in the vector space V, then there is a basis T of V which contains the set S.

Example

Let W be the sub-space of \mathbb{R}^5 generated by the set of following vectors:

$$v_1 = (1, 0, 2, -1, 2), v_2 = (2, 0, 4, -2, 4), v_3 = (1, 2, -1, 2, 0), v_4 = (1, 4, -4, 5, -2).$$

• Find a basis of the sub-space W in $\{v_1, v_2, v_3, v_4\}$.

2 Find a basis of \mathbb{R}^5 and contains $\{v_1, v_3\}$.

Solution

Mongi BLEL The Vector Spaces

2 If
$$e_1 = (1, 0, 0, 0, 0)$$
, $e_2 = (0, 1, 0, 0, 0)$, $e_3 = (0, 0, 1, 0, 0)$.
Then $\{v_1, v_3, e_1, e_2, e_3\}$ is basis of \mathbb{R}^5 and contains $\{v_1, v_3\}$.

Example

Let
$$W = \{(x, y, z, t) \in \mathbb{R}^4; 2x + y + z = 0, x - y + z = 0\}$$

- **1** Prove that W is sub-space of \mathbb{R}^4
- **2** Find basis of the sub-space W.

Solution

•
$$u = (x, y, z, t) \in W \iff AX = 0$$
, where
 $A = \begin{pmatrix} 2 & 1 & 1 & 0 \\ 1 & -1 & 1 & 0 \end{pmatrix}$, $X = \begin{pmatrix} x \\ y \\ z \\ t \end{pmatrix}$.

Since the set of solutions of an homogeneous linear system is a vector sub-space, then W is vector sub-space of \mathbb{R}^4 .

Mongi BLEL The Vector Spaces

$$AX = 0 \iff \begin{cases} 2x + y + z = 0\\ x - y + z = 0 \end{cases} \iff \begin{cases} x = -2y\\ z = 3y \end{cases}$$
$$\iff X = y \begin{pmatrix} -2\\1\\3\\0 \end{pmatrix} + t \begin{pmatrix} 0\\0\\0\\1 \end{pmatrix}.$$

Then $\{(-2,1,3,0), (0,0,0,1)\}$ is basis of the vector sub-space W.

Example

In the vector space $V = \mathbb{R}^3$, give a set S of vectors in V such that S generates the vector space V and not linearly independent. Solution

We can take

$$S = \{(1,0,0)\}$$
 and $T = \{(1,0,0), (0,1,0), (0,0,1), (1,1,1)\}.$

Coordinate System and Change of Basis

Definition

If $S = \{v_1, \ldots, v_n\}$ is a basis of the vector space V and if $v \in V$ such that

$$v = x_1v_1 + \ldots x_nv_n$$

then (x_1, \ldots, x_n) are called the system of coordinates of the vector v with respect to the basis S. We denote

$$[v]_{\mathcal{S}} = \begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix}$$

and called the vector of coordinates of the vector v with respect to the basis S. Mongi BLEL

The Vector Spaces

Theorem

If $B = \{v_1, \ldots, v_n\}$ and $C = \{u_1, \ldots, u_n\}$ are two basis of the vector space V. We define the matrix $_{C}P_B$ of type n such that its columns are $[v_1]_C, \ldots, [v_n]_C$. This matrix $_{C}P_B$ has an inverse and

$$[v]_C = {}_C P_B[v]_B$$

for all $v \in V$. The matrix $_{C}P_{B}$ is called the change of basis matrix from the basis B to the basis C.

Exercise

Let
$$B = \{v_1 = (0, 1, 1), v_2 = (1, 0, -2), v_3 = (1, 1, 0)\}$$
 be a basis of the vector space \mathbb{R}^3 and let $C = \{u_1 = (1, 0, 0), u_2 = (0, 1, 0), u_3 = (0, 0, 1)\}$ be the standard basis of the vector space \mathbb{R}^3 .

• Find the following matrix $_{C}P_{B}$ and $_{B}P_{C}$.

2 Find
$$[v]_B$$
 if $[v]_C = \begin{pmatrix} 1\\ 0\\ -1 \end{pmatrix}$.

Exercise

•
$$_{C}P_{B} = \begin{pmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & -2 & 0 \end{pmatrix} _{B}P_{C} = \begin{pmatrix} -2 & 2 & -1 \\ -1 & 1 & -1 \\ 2 & -1 & 1 \end{pmatrix}.$$

• $[v]_{B} = _{B}P_{C}[v]_{C} = \begin{pmatrix} -1 \\ 0 \\ 1 \end{pmatrix}.$

Example

Prove that in \mathbb{R}^3 , the vectors u = (1,0,1), v = (-1,-1,2) and w = (-2,1,-2) form a basis and find the coordinate system of the vector X = (x, y, z) in this basis.

Solution

The matrix which columns the vectors u = (1, 0, 1), v = (-1, -1, 2)and w = (-2, 1, -2) is $A = \begin{pmatrix} 1 & -1 & -2 \\ 0 & -1 & 1 \\ 1 & 2 & -2 \end{pmatrix}$. Since |A| = -3, then u = (1, 0, 1), v = (-1, -1, 2) and w = (-2, 1, -2) is a basis of the vector space \mathbb{R}^3 . If X = au + bv + cw then $\begin{pmatrix} a \\ b \\ c \end{pmatrix} = A^{-1}X = \begin{pmatrix} 2y + z \\ \frac{-x+2}{3} \\ \frac{-x+3y+z}{3} \end{pmatrix}$.

Example

Prove that the system of vectors $S = \{(1, 1, 1), (-1, 1, 0), (1, 0, -1)\}$ is a basis of the vector space \mathbb{R}^3 .

Find the coordinates of the following vectors (1,0,0), (1,0,1) and (0,0,1) in this basis.

Solution:

$$\begin{vmatrix} 1 & -1 & 1 \\ 1 & 1 & 0 \\ 1 & 0 & -1 \end{vmatrix} = -3 \neq 0.$$

Then *S* is a basis of the vector space \mathbb{R}^3 .
 $(1,0,0) = \frac{1}{3}(1,1,1) - \frac{1}{3}(-1,1,0) + \frac{1}{3}(1,0,-1).$
Then coordinates in the basis *S* is $(\frac{1}{3}, -\frac{1}{3}, \frac{1}{3}).$

Solution

 $\begin{array}{l} (0,0,1)=\frac{1}{3}(1,1,1)-\frac{1}{3}(-1,1,0)-\frac{2}{3}(1,0,-1).\\ \text{Then coordinates in the basis S is $(\frac{1}{3},-\frac{1}{3},-\frac{2}{3})$.\\ (1,0,1)=(1,0,0)+(0,0,1).\\ \text{Then coordinates in the basis S is $(\frac{2}{3},-\frac{2}{3},-\frac{1}{3})$. \end{array}$

Definition

Let A be a matrix of type (m, n).

The vector sub-space of \mathbb{R}^n spanned by the rows of the matrix A is called the row vector space of the matrix A and denoted by: row(A).

The vector sub-space of \mathbb{R}^m spanned by the columns of the matrix A is called the column vector space of the matrix A and denoted by: $\operatorname{col}(A)$.

Theorem

Let A be a matrix of type (m, n). If B is any matrix which is a result of some row operations on the matrix A, then row(A) = row(B).

Theorem

Let A be a matrix of type (m, n) and if B any row echelon form of the matrix A. Then the set of non zero rows of the matrix B are linearly independent.

Definition

```
Let A be a matrix of type (m, n).
The dimension of the vector space row(A) is called the rank of the A.
rank(A) = dim(row(A)).
```

Remark

Let A be a matrix of type (m, n).

The rank of the matrix A is the numbers of leading numbers in any row echelon form of the matrix A.

Mongi BLEL The Vector Spaces

Theorem

Let A be a matrix of type (m, n), then

$$\operatorname{rank}(A) = \operatorname{dim}(\operatorname{row}(A)) = \operatorname{dim}(\operatorname{col}(A)).$$

Corollary

Let A be a matrix of type (m, n), then

 $\operatorname{rank}(A) = \operatorname{rank}(A^{\mathsf{T}}).$

Corollary

If A is a matrix of type (m, n) and P is any invertible matrix of type m and Q an invertible matrix of type n, then

 $\operatorname{rank}(A) = \operatorname{rank}(PAQ).$

Proof

There E_1, \ldots, E_p elementary matrix of order m such that $P = E_1 \ldots E_p$.

We know that if E is a elementary matrix which corresponds to an elementary row operation R, then EA is the result of the elementary row operation R on the matrix A. Then

 $\operatorname{rank}(A) = \operatorname{rank}(PA).$

 $\begin{aligned} \mathsf{Also} \operatorname{rank}(\mathsf{P}\mathsf{A}\mathsf{Q}) &= \operatorname{rank}(\mathsf{P}\mathsf{A}\mathsf{Q})^\mathsf{T} = \operatorname{rank}(\mathsf{Q}^\mathsf{T}\mathsf{A}^\mathsf{T}\mathsf{P}^\mathsf{T}) = \operatorname{rank}(\mathsf{A}^\mathsf{T}\mathsf{P}^\mathsf{T}) = \operatorname{rank}(\mathsf{A}\mathsf{A}) = \operatorname{rank}(\mathsf{A}\mathsf{A}). \end{aligned}$

Theorem

If A is a matrix of type (m, n). We have the equivalence of the following statements:

- The homogeneous system AX = 0 has 0 as unique solution.
- The columns of the matrix A are linearly independent.

$$\mathbf{3} \operatorname{rank}(A) = n.$$

• The matrix $A^T A$ has an inverse.

Theorem

Let A be a matrix of type (m, n). We have the equivalence of the following statements

- The system AX = B is consistent for all $B \in \mathbb{R}^m$.
- **2** The columns of the matrix A generates the vector space \mathbb{R}^m .

$$\mathbf{3} \ \operatorname{rank}(A) = m.$$

• The matrix AA^T has an inverse.

Definition

Let A be a matrix of type (m, n). The vector sub-space

 $\{X \in \mathbb{R}^n; AX = 0\}$

is called the nullspace of the matrix A and denoted by: N(A). Its dimension is denoted by nullity(A). Also the vector sub-space

 $\{AX; X \in \mathbb{R}^n\}$

is called the image of the matrix A and denoted by: Im(A).

Theorem

Let A be a matrix of type (m, n). Then Im(A) = col(A).

Rank-Nullity Theorem

For any matrix A of type (m, n),

 $\operatorname{nullity}(A) + \operatorname{rank}(A) = n.$

Example

Let the matrix
$$A = \begin{pmatrix} 1 & 2 & -1 & -1 \\ 0 & -1 & 2 & 3 \\ 2 & 3 & 0 & 1 \\ 1 & 1 & 1 & 2 \end{pmatrix}$$

- Find a basis of the vector space N(A).
- **2** Find a basis of the vector space Col(A).
- **③** Find the rank of the matrix A.

Solution

The reduced row form the matrix A is
$$\begin{pmatrix} 1 & 0 & 3 & 5 \\ 0 & 1 & -2 & -3 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}.$$

• (-3,2,1,0), (-5,3,0,1) is basis of the vector space N(A) ...

- **2** (0,1,2,1), (-1,2,3,1) is a basis of the vector space Col(A).
- **③** The rank of the matrix A is 2.

Example

Let
$$e_1 = (0, 1, -2, 1)$$
, $e_2 = (1, 0, 2, -1)$, $e_3 = (3, 2, 2, -1)$, $e_4 = (0, 0, 1, 0)$ and $e_5 = (0, 0, 0, 1)$ vectors in \mathbb{R}^4 .
Is the following statements are true?

• Vect
$$\{e_1, e_2, e_3\}$$
 = Vect $\{(1, 1, 0, 0), (-1, 1, -4, 2)\}$.

2
$$(1,1,0,0) \in \operatorname{Vect}\{e_1,e_2\} \cap \operatorname{Vect}\{e_2,e_3,e_4\}.$$

3 Vect
$$\{e_1, e_2\}$$
 + Vect $\{e_2, e_3, e_4\} = \mathbb{R}^4$.

Solution

• Let the matrix A which rows are the vectors e_1, e_2, e_3 . The vector space $\operatorname{Vect}\{e_1, e_2, e_3\}$ is the row vector space of the matrix A. The reduced row form of the matrix A is $A_1 = \begin{pmatrix} 1 & 0 & 2 & -1 \\ 0 & 1 & -2 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$. Then dim $\operatorname{Vect}\{e_1, e_2, e_3\} = 2$. We have $\operatorname{Vect}\{e_1, e_2, e_3\} = \operatorname{Vect}\{(1, 1, 0, 0), (-1, 1, -4, 2)\}$ if and only if the rank of the following matrix B is 2

$$B = \begin{pmatrix} 1 & 0 & 2 & -1 \\ 0 & 1 & -2 & 1 \\ -1 & 1 & -4 & 2 \\ 1 & 1 & 0 & 0 \end{pmatrix}.$$

The reduced row form of the matrix *B* is
$$A_2 = \begin{pmatrix} 1 & 0 & 2 & -1 \\ 0 & 1 & -2 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$
.
Then

,

$$\operatorname{Vect}\{e_1, e_2, e_3\} = \operatorname{Vect}\{(1, 1, 0, 0), (-1, 1, -4, 2)\}.$$

Mongi BLEL The Vector Spaces

②
$$(1,1,0,0) = e_1 + e_2$$
, $2(1,1,0,0) = e_3 - e_2$.
Then $(1,1,0,0) \in \operatorname{Vect}\{e_1,e_2\} \cap \operatorname{Vect}\{e_2,e_3,e_4\}$.

$$\begin{array}{l} (1,1,0,0) \in \operatorname{Vect}\{e_1,e_2\} \cap \operatorname{Vect}\{e_2,e_3,e_4\} \text{ and } \\ e_2 \in \operatorname{Vect}\{e_1,e_2\} \cap \operatorname{Vect}\{e_2,e_3,e_4\}. \\ \\ \text{Then } \dim\operatorname{Vect}\{e_1,e_2\} \cap \operatorname{Vect}\{e_2,e_3,e_4\} = 2 \text{ and } \end{array}$$

$$\operatorname{dimVect}\{e_1,e_2\}+\operatorname{Vect}\{e_2,e_3,e_4\}\leq 3$$

Then $\operatorname{Vect}\{e_1, e_2\} + \operatorname{Vect}\{e_2, e_3, e_4\} \neq \mathbb{R}^4$.

Mongi BLEL The Vector Spaces

Example

Let in \mathbb{R}^3 the vectors, $u_1 = (1, 2, 1)$, $u_2 = (1, 3, 2)$, $u_3 = (1, 1, 0)$ and $u_4 = (3, 8, 5)$. Let $F = \text{Vect}(u_1, u_2)$ and $G = \text{Vect}(u_3, u_4)$. Prove that F = G.

Solution

As the vectors u_1, u_2 are linearly independent and also the vectors u_3, u_4 are linearly independent, then $\dim E = \dim F = 2$. F = G if and only if the rank of the following matrix is 2, $A = \begin{pmatrix} 1 & 2 & 1 \\ 1 & 3 & 2 \\ 1 & 1 & 0 \\ 3 & 8 & 5 \end{pmatrix}$. $\begin{pmatrix} 1 & 0 & -1 \end{pmatrix}$

The reduced row form of this matrix is

$$\begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

Then F = G.
