# **(5) Some Continuous Probability Distributions**

( Book\*: Chapter 6 ,pg171)

Probability & Statistics for Engineers & Scientists  
By Walpole, Myers, Myers, Ye

## 5.1 Normal Distribution:

- The probability density function of the normal random variable  $\mathbf{X}$ , with mean  $\mu$  and variance  $\sigma^2$  is given by:

$$f(x, \mu, \sigma^2) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}, \quad -\infty < x < \infty$$

## 5.1.1 The Normal Curve has the Following Properties:

- The mode, which is the point on the horizontal axis where the curve is a maximum, occurs at  $X = \mu$  , (Mode = Median = Mean).
- The curve is symmetric about a vertical axis through the mean  $\mu$  .

- The total area under the curve and above the horizontal axis is equal to **1**.

# Definition: Standard Normal Distribution:

- The distribution of a normal random variable with mean **zero** and variance **one** is called a standard normal distribution denoted by  $Z \approx N(0, 1)$

- Areas under the Normal Curve:

$$X \approx N(\mu, \sigma)$$

$$Z = \frac{X - \mu}{\sigma} \approx N(0, 1)$$

- Using the standard normal tables to find the areas under the curve.

The pdf of  $Z \sim N(0,1)$  is given by:

## EX (1):

Using the tables of the standard normal distribution, find:

$$(a) P(Z < 2.11)$$

$$(b) P(Z > -1.33)$$

$$(c) P(Z = 3)$$

$$(d) P(-1.2 < Z < 2.1)$$

# Solution:

$$(a) P(Z < 2.11) = 0.9826$$

$$(b) P(Z > -1.33) = 1 - 0.0918 = 0.9082$$

$$(c) P(Z = 3) = 0$$

$$(d) P(-1.2 < Z < 2.1) = 0.9821 - 0.1151 = 0.867$$

See Ex: 6.2, 6.3,  
pg 178-179

## EX (6.2 pg 178):

Using the standard normal tables, find the area under the curve that lies:

A. to the right of  $Z=1.84$

B. to the left of  $z=2.51$

C. between  $z=-1.97$  and  $z=0.86$

A. at the point  $z= -2. 15$

# Solution:

A. to the right of  $Z=1.84$

$$P(Z > 1.84) = 1 - 0.9671 = 0.0329$$

B. to the left of  $z=2.51$

$$P(Z < 2.51) = 0.9940$$

C. between  $z=-1.97$  and  $z=0.86$

$$P(-1.97 < Z < 0.86) = 0.8051 - 0.0244 = 0.7807$$

D. at the point  $z = -2.15$

$$P(Z = -2.15) = 0$$

## EX (6.4 pg 179):

Given a normal distribution with  $\mu=50$  ,  $\sigma=10$  . Find the probability that **X** assumes a value between **45** and **62**.

### Solution:

$$\begin{aligned} P(45 < X < 62) &= P\left(\frac{45 - 50}{10} < Z < \frac{62 - 50}{10}\right) = P(-0.5 < Z < 1.2) \\ &= 0.8849 - 0.3085 = 0.5764 \end{aligned}$$

EX(6.5 pg 180) :

Given a normal distribution with  $\mu=300$  ,  
 $\sigma=50$ , find the probability that **X** assumes a  
value greater than **362**.

Solution:

$$\begin{aligned} P(X > 362) &= P\left(Z > \frac{362 - 300}{50}\right) = P(Z > 1.24) \\ &= 1 - 0.8925 = 0.1075 \end{aligned}$$

## Applications of the Normal Distribution:

### EX (1):

The reaction time of a driver to visual stimulus is normally distributed with a mean of **0.4** second and a standard deviation of **0.05** second.

(a) What is the probability that a reaction requires more than **0.5** second?

(b) What is the probability that a reaction requires between **0.4** and **0.5** second?

(c ) Find mean and variance.

# Solution:

$$\mu_X = 0.4, \sigma_X = 0.05$$

(a) What is the probability that a reaction requires more than **0.5** second?

$$\begin{aligned} (a) P(X > 0.5) &= P\left(Z > \frac{0.5 - 0.4}{0.05}\right) = P(Z > 2) \\ &= 1 - 0.9772 = 0.0228 \end{aligned}$$

(b) What is the probability that a reaction requires between 0.4 and 0.5 second?

$$\begin{aligned}(b) P(0.4 < X < 0.5) &= P\left(\frac{0.4 - 0.4}{0.05} < Z < \frac{0.5 - 0.4}{0.05}\right) \\ &= P(0 < Z < 2) = 0.9772 - 0.5 = 0.4772\end{aligned}$$

(c ) Find mean and variance.

$$(c) \mu = 0.4, \sigma^2 = 0.0025$$

## EX (2):

The line width of a tool used for semiconductor manufacturing is assumed to be normally distributed with a mean of 0.5 micrometer and a standard deviation of 0.05 micrometer.

- (a) What is the probability that a line width is greater than 0.62 micrometer?
- (b) What is the probability that a line width is between 0.47 and 0.63 micrometer?

## Solution:

(a) What is the probability that a line width is greater than 0.62 micrometer?

$$\mu_X = 0.5, \quad \sigma_X = 0.05$$

$$\begin{aligned} (a) P(x > 0.62) &= P\left(Z > \frac{0.62 - 0.5}{0.05}\right) = P(Z > 2.4) \\ &= 1 - 0.9918 = 0.0082 \end{aligned}$$

**(b) What is the probability that a line width is between 0.47 and 0.63 micrometer?**

$$\begin{aligned}(b) P(0.47 < X < 0.63) &= P\left(\frac{0.47 - 0.5}{0.05} < Z < \frac{0.63 - 0.5}{0.05}\right) \\ &= P(-0.6 < Z < 2.6) = 0.9953 - 0.2743 = 0.721\end{aligned}$$

See Ex 6.7, 6.8 pg 182

Normal Approximation to the  
Binomial(Reading):  
Theorem:

If  $X$  is a binomial random variable with mean  $\mu = n p$  and variance  $\sigma^2 = n p q$ , then the limiting form of the distribution of

$$Z = \frac{X - n p}{\sqrt{n p q}} \quad \text{as } n \rightarrow \infty$$

is the standard normal distribution  $N(0, 1)$ .

## EX

The probability that a patient recovers from rare blood disease is **0.4**. If **100** people are known to have contracted this disease, what is the probability that less than **30** survive?

# Solution:

$$n = 100 \quad , \quad p = 0.4 \quad , \quad q = 0.6$$

$$\mu = np = (100)(0.4) = 40 \quad ,$$

$$\sigma = \sqrt{npq} = \sqrt{(100)(0.4)(0.6)} = 4.899$$

$$P(X < 30) = P\left(Z < \frac{30 - 40}{4.899}\right) = P(Z < -2.04) = 0.0207$$

## EX (6.16, pg 192)

A multiple – choice quiz has **200** questions each with **4** possible answers of which only **1** is the correct answer. What is the probability that sheer guess – work yields from **25** to **30** correct answers for **80** of the **200** problems about which the student has no knowledge?

# Solution:

$$p = np = (80)(0.25) = 20 \quad ,$$

$$\sigma = \sqrt{npq} = \sqrt{(80)(0.25)(0.75)} = 3.873$$

$$P(25 < X < 30) = P\left(\frac{25 - 20}{3.873} < Z < \frac{30 - 20}{3.873}\right) = P(1.29 < Z < 2.58) = 0.9951 - 0.9015 = 0.0936$$
