

Example (1)

You are a financial analyst for a brokerage firm. Is there a difference in dividend yield between stocks listed on the NYSE & NASDAQ? You collect the following data:

NYSE: $n_1 = 21$, $\bar{X}_1 = 3.27$, $S_1 = 1.30$

NASDAQ: $n_2 = 25$, $\bar{X}_2 = 2.53$, $S_2 = 1.16$

Assuming both populations are approximately normal with equal variances, is there a difference in mean yield ($\alpha = 0.05$)?

Solution:

(σ_1 & σ_2 unknown) ($\sigma_1 = \sigma_2$) t

Step 1: state the hypothesis:

$$H_0: \mu_1 = \mu_2$$

$$H_1: \mu_1 \neq \mu_2$$

Test is two-tailed test (key word is difference between 2 samples)

Step 2- Select the level of significance and critical value.

$\alpha = 0.05$ as stated in the problem

$$\pm t\left(\frac{\alpha}{2}, n_1+n_2-2\right) = \pm t\left(\frac{0.05}{2}, 21+25-2\right) = \pm t(0.025, 44) = \pm 2.0154$$

Step 3: Select the test statistic.

Use Z-distribution since the assumptions are met

$$S_p^2 = \frac{(n_1 - 1)S_1^2 + (n_2 - 1)S_2^2}{(n_1 - 1) + (n_2 - 1)} = \frac{(21 - 1) \times 1.3^2 + (25 - 1) \times 1.16^2}{(21 - 1) + (25 - 1)}$$
$$= \frac{33.8 + 32.2944}{44} = \frac{66.0944}{44} = 1.5021$$

$$t = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{S_p^2 \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}}$$

$$t_{stat} = \frac{3.27 - 2.53}{\sqrt{1.5021 \left(\frac{1}{21} + \frac{1}{25} \right)}} = \frac{0.74}{0.3627} = 2.040$$

Step 4: Formulate the decision rule. (Critical value)

Reject H_0 if $t_c > 2.0154$ Or $t_c < -2.0154$

Step 5: Make a decision and interpret the result.

$$\begin{array}{l} \times \quad H_0: \mu_1 \leq \mu_2 \\ \checkmark \quad H_1: \mu_1 > \mu_2 \end{array}$$

Reject H_0 at $\alpha = 0.05$, There is evidence of a difference in means.

Reject H_0 . There is sufficient evidence that $\mu_{NYSE} > \mu_{NASDAQ}$

95% Confidence Interval for $\mu_{\text{NYSE}} - \mu_{\text{NASDAQ}}$

$$(\bar{X}_1 - \bar{X}_2) \pm t_{\alpha/2} \sqrt{S_p^2 \left(\frac{1}{n_1} + \frac{1}{n_2} \right)} = 0.74 \pm 2.0154 \times 0.3628 = (0.009, 1.471)$$

Since 0 is less than the entire interval, we rejected H_0 and we can be 95% confident that $\mu_{\text{NYSE}} > \mu_{\text{NASDAQ}}$

Example (2)

Assume you send your salespeople to a “customer service” training workshop. Has the training made a difference in the number of complaints (at the 0.01 level)? You collect the following data:

| <u>Salesperson</u> | <u>Number of Complaints</u> | <u>Number of Complaints</u> |
|--------------------|-----------------------------|-----------------------------|
| | Before | After |
| C.B. | 6 | 4 |
| T.F. | 20 | 6 |
| M.H. | 3 | 2 |
| R.K. | 0 | 0 |
| M.O. | 4 | 0 |

Solution:

Step 1: state the hypothesis:

$$H_0: \mu_D = 0$$

$$H_1: \mu_D \neq 0$$

Step2: Select the level of significance and critical value.

$$t_{0.005} = \pm 4.604 \quad \text{d.f.} = n - 1 = 4$$

Step 3: Find the appropriate test statistic.

| <u>Salesperso</u> <u>n</u> | <u>Number of</u> <u>Complaints</u> Before | <u>Number of</u> <u>Complaints</u> After | D (X2-X1) | $(D_i - \bar{D})$ | $(D_i - \bar{D})^2$ |
|-------------------------------|---|--|----------------|-------------------|---------------------|
| C.B. | 6 | 4 | -2 | -2-(-4.2)= 2.2 | 4.84 |
| T.F. | 20 | 6 | -14 | -14-(-4.2)=-9.8 | 96.04 |
| M.H. | 3 | 2 | -1 | -1-(-4.2)= 3.2 | 10.24 |
| R.K. | 0 | 0 | 0 | 0-(-4.2)=4.2 | 17.64 |
| M.O. | 4 | 0 | -4 | 4-(-4.2)=0.2 | 0.04 |
| Total | | | -21 | | 128.8 |

$$\bar{D} = \frac{\sum D_i}{n} = \frac{-21}{5} = -4.2$$

$$S_D = \sqrt{\frac{\sum (D_i - \bar{D})^2}{n - 1}} = \sqrt{\frac{128.8}{4}} = 5.6745$$

$$t_c = \frac{\bar{D}}{S_D / \sqrt{n}} = \frac{-4.2}{5.6745 / 2.2361} = \frac{-4.2}{2.5377} = -1.66$$

Step 4: State the decision rule

Reject H_0 if

$$t_c > 4.604$$

or

$$t_c < -4.604$$

Step 5: Decision Reject H_0

$$\begin{array}{l} \checkmark \quad H_0: \mu_D = 0 \\ \times \quad H_1: \mu_D \neq 0 \end{array}$$

Do not reject H_0 (t_{stat} is not in the rejection region)

Do not reject H_0 . There is insufficient of a change in the number of complaints.

$$\mu_{\text{complaints before training workshop}} = \mu_{\text{complaints after training workshop}}$$

-The Paired Difference Confidence Interval μ_D is:

$$\begin{aligned} \hat{\mu}_D &= \bar{D} \pm t_{\alpha/2} \frac{S_D}{\sqrt{n}} \\ &= -4.2 \pm 4.604 \frac{5.6745}{\sqrt{5}} \\ &= -4.2 \pm 11.6836 \\ -15.87 &< \hat{\mu}_D < 7.48 \end{aligned}$$

Since this interval contains 0 you are 99% confident that $\mu_D = 0$

Do not reject H_0

$$\mu_{\text{complaints before training workshop}} = \mu_{\text{complaints after training workshop}}$$

Example (3)

Is there a significant difference between the proportion of men and the proportion of women who will vote Yes on Proposition A?

In a random sample, 36 of 72 men and 35 of 50 women indicated they would vote Yes

Test at the .05 level of significance

Solution:

Step 1: State the null and alternate hypotheses.

$H_0: \pi_1 - \pi_2 = 0$ (the two proportions are equal)

$H_1: \pi_1 - \pi_2 \neq 0$ (there is a significant difference between proportions)

Step 2: State the level of significance and critical value.

The .05 significance level is stated in the problem.

$$\pm Z_{\frac{\alpha}{2}} = \pm Z_{\frac{0.05}{2}} = \pm Z_{0.025}$$

$$\pm Z_{0.025} = \pm 1.96$$

Step 3: Find the appropriate test statistic.

The sample proportions are:

$$\text{Men: } p_1 = 36/72 = 0.50$$

$$\text{Women: } p_2 = 35/50 = 0.70$$

The pooled estimate for the overall proportion is:

$$\bar{p} = \frac{X_1 + X_2}{n_1 + n_2} = \frac{36 + 35}{72 + 50} = \frac{71}{122} = .582$$

$$\begin{aligned} z_{\text{STAT}} &= \frac{(p_1 - p_2) - (\pi_1 - \pi_2)}{\sqrt{\bar{p}(1 - \bar{p}) \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}} \\ &= \frac{(.50 - .70) - (0)}{\sqrt{.582(1 - .582) \left(\frac{1}{72} + \frac{1}{50} \right)}} = -2.20 \end{aligned}$$

Step 4: State the decision rule

$$\begin{aligned} \text{Reject } H_0 \text{ if } & \begin{matrix} Z_c > Z_{\frac{\alpha}{2}} \\ Z_c > 1.96 \end{matrix} \quad \text{Or} \quad \begin{matrix} Z_c < -Z_{\frac{\alpha}{2}} \\ Z_c < -1.96 \end{matrix} \end{aligned}$$

Step 5: Decision Reject H_0

There is evidence of a significant **difference** in the proportion of men and women who will vote yes.

$$\begin{array}{l} \times \quad H_0: \pi_1 \leq \pi_2 \\ \checkmark \quad H_1: \pi_1 > \pi_2 \end{array}$$

Reject H_0 . There is sufficient evidence that $\pi_{weman} > \pi_{men}$

The confidence interval for

$\pi_1 - \pi_2$ is:

$$(p_1 - p_2) \pm Z_{\alpha/2} \sqrt{\frac{p_1(1-p_1)}{n_1} + \frac{p_2(1-p_2)}{n_2}}$$

The 95% confidence interval for $\pi_1 - \pi_2$ is:

$$\begin{aligned} (0.50 - 0.70) \pm 1.96 \sqrt{\frac{0.50(0.50)}{72} + \frac{0.70(0.30)}{50}} \\ = (-0.37, -0.03) \end{aligned}$$

Since this interval does not contain 0 can be 95% confident the two proportions are different. There is sufficient evidence that $\pi_{weman} > \pi_{men}$

Example (4)

You are a financial analyst for a brokerage firm. Is there a difference in dividend yield between stocks listed on the NYSE & NASDAQ? You collect the following data:

NYSE: $n_1 = 21$, $S_1 = 1.30$

NASDAQ: $n_2 = 25$, $S_2 = 1.16$

Is there a difference in the variances between the NYSE & NASDAQ at the $\alpha = 0.05$ level?

Step 1: state the hypothesis:

$H_0: \sigma^2_1 = \sigma^2_2$ (there is no difference between variances)

$H_1: \sigma^2_1 \neq \sigma^2_2$ (there is a difference between variances)

Step2: Select the level of significance and critical value.

Find the F critical value for $\alpha = 0.05$:

Numerator d.f. = $n_1 - 1 = 21 - 1 = 20$

Denominator d.f. = $n_2 - 1 = 25 - 1 = 24$

$$F_{\alpha/2} = F_{.025, 20, 24} = 2.33$$

Step 3: Find the appropriate test statistic.

The test statistic is:

$$F_{STAT} = \frac{S_1^2}{S_2^2} = \frac{1.30^2}{1.16^2} = 1.256$$

Step 4: State the decision rule

Reject H_0 if $F_{STAT} > F_{\alpha/2} = 2.33$

$F_{STAT} = 1.256$ is not in the rejection region, so we do not reject H_0

Step 5: Decision Reject H_0

because $F_{stat} = 1.256 < 2.33$, you do not reject H_0 . using a 0.05 level of significance, you conclude that there is evidence that there is no variability in the NYSE & NASDAQ.

Do not reject the null hypothesis, there was no significant difference between two variances ($\sigma_1^2 = \sigma_2^2$). The test statistic will be use is Pooled variance t-test

✓ $H_0: \sigma_1^2 = \sigma_2^2$ (there is no difference between variances)

× $H_1: \sigma_1^2 \neq \sigma_2^2$ (there is a difference between variances)

| Cumulative Probabilities = 0.975 | | | | | | | | | | | | | |

Example (5) Text book pages (372 & 373)

Waiting time is a critical issue at fast-food chains, which not only want to minimize the mean service time but also want to minimize the variation in the service time from customer to customer. One fast-food chain carried out a study to measure the variability in the waiting time (defined as the time in minutes from when an order was completed to when it was delivered to the customer) at lunch and breakfast at one of the chain's stores. The results were as follows:

Lunch: $n_1 = 25$, $S_1^2 = 4.4$

Breakfast: $n_2 = 21$, $S_2^2 = 1.9$

At the 0.05 level of significance, is there evidence that there is more variability in the service time at lunch than at breakfast? Assume that the population service times are normally distributed

Solution

1)

$$H_0: \sigma_1^2 \leq \sigma_2^2$$

$$H_1: \sigma_1^2 > \sigma_2^2$$

2)

$$F_{\alpha, n_1-1, n_2-1} = F_{0.05, 25-1, 21-1} = F_{0.05, 24, 20} = 2.08$$

3)

$$F_{stat} = \frac{S_1^2}{S_2^2} = \frac{4.4}{1.9} = 2.3158$$

4)

Reject H_0 if $F_{stat} > 2.08$

5) because $F_{stat} = 2.3158 > 2.08$, you reject H_0 . using a 0.05 level of significance, you conclude that there is evidence that there is more variability in the service time at lunch than at breakfast.

Reject the null hypothesis, there was a significant difference between two variances ($\sigma_1^2 \neq \sigma_2^2$). The test statistic will be use is Separate variance t-test

$$\begin{array}{l} \times \\ \sqrt \end{array} \quad \begin{array}{l} H_0: \sigma_1^2 \leq \sigma_2^2 \\ H_1: \sigma_1^2 > \sigma_2^2 \end{array}$$

Example (6) An experiment has a single factor with four groups and nine values in each group.

If $SSA=752$, $SST=1250$

Answer the following questions:

1) How many degrees of freedom are there in determining the among-group variation?

2) How many degrees of freedom are there in determining the within-group variation?

3) How many degrees of freedom are there in determining the total variation?

4) What is SSW ?

5) What is MSA ?

6) What is MSW ?

7) What is the value of F_{stat} ?

Solution:

1) How many degrees of freedom are there in determining The among-group variation?

$$c-1=4-1=3$$

2) How many degrees of freedom are there in determining The within-group variation?

$$n = 4 \times 9 = 36$$

$$n-c=36-4=32$$

3) How many degrees of freedom are there in determining The total variation?

$$n-1=36-1=35$$

4)What is SSW ?

$$SST-SSA=1250-752=498$$

5)What is MSA?

$$MSA = \frac{752}{3} = 250.67$$

6)What is MSW?

$$MSW = \frac{498}{32} = 15.5625$$

7)What is the value of F_{stat} ?

$$F_{stat} = \frac{MSA}{MSW} = \frac{250.67}{15.5625} = 16.11$$

Example (7) (Slide 65-68)

You want to see if three different golf clubs yield different distances. You randomly select five measurements from trials on an automated driving machine for each club. At the 0.05 significance level, is there a difference in mean distance?

| | Club 1 | Club 2 | Club 3 |
|-----------------|--------|--------|--------|
| | 254 | 234 | 200 |
| | 263 | 218 | 222 |
| | 241 | 235 | 197 |
| | 237 | 227 | 206 |
| | 251 | 216 | 204 |
| Total | 1246 | 1130 | 1029 |
| Mean | 249.2 | 226 | 205.8 |
| $\bar{X} = 227$ | | | |

C=3

n=15

SSA = 4716.4 , SSW = 1119.6

Solution:

| Source of variation (S.V) | Degrees of freedom | Sum of Squares (S.S) | Mean Squares (MS) | F- ratio |
|---------------------------|--------------------|----------------------|--|--|
| Among groups | c-1=3-1=2 | SSA=4716.4 | MSA =SSA/c-1 $\frac{4716.4}{2}$ = 2358.2 | F _{STAT} = MSA / MSW = $\frac{2358.2}{93.3}$ = 25.275 |
| Within groups | n-c=15-3=12 | SSW=1119.6 | MSW = SSW/n-c $\frac{1119.6}{12}$ = 93.3 | |
| Total | n-1=15-1=14 | SST=5836 | | |

Step (1) : State the null and alternate hypotheses :

$$H_0 : \mu_1 = \mu_2 = \mu_3$$

H_1 : Not all μ_j are equal(Not all the means are equal.).

Step (2): Select the level of significance ($\alpha = 0.05$)

Step (3): The test statistic :

$$F_{STAT} = \frac{MSA}{MSW} = \frac{SSA/c - 1}{SSW/n - c} = \frac{4716.4/3 - 1}{1119.6/15 - 3} = 25.275$$

Step (4): The critical value:

The degrees of freedom for the numerator (c-1) = 3-1 =2

The degrees of freedom for the denominator (n-c) = 15-3 =12

$$F_{(0.05, 2, 12)} = 3.89$$

Step (5) : Formulate the decision Rule and make a decision

$$F_{STAT} (25.275) > F_{(0.05, 2, 12)} (3.89)$$

Reject H_0 at $\alpha = 0.05$

There is evidence that at least one μ_j differs from the rest

Since $F_{stat} > 3.89$, we reject H_0 . And there is sufficient evidence that at least one μ_j differs .

Example (8) Text book page 386

Consider an experiment with four groups, with eight values in each. For the ANOVA summary table below, fill in all the missing results:

ANOVA

| Sources of variation | Degree of freedom | Sum of squares | Mean squares MS. | F-ratio |
|----------------------|-------------------|----------------|------------------|--------------|
| Among groups | $c-1=?$ | $SSA=?$ | $MSA=80$ | $F_{STAT}=?$ |
| Within groups | $n-c=?$ | $SSW=560$ | $MSW=?$ | |
| Total | $n-1=?$ | $SST=?$ | | |

a) At the 0.05 level of significance, state the decision rule for testing the null hypothesis that all four groups have equal population means.

b) What is your statistical decision?

Solution:

$$\text{Step (1) } c-1=4-1=3, \quad n=4 \times 8=32, \quad n-c=32-4=28, \quad n-1=32-1=31$$

$$\text{Step (2) } SSA = MSA \times (c - 1) = 80 \times 3 = 240$$

$$\text{Step (3) } MSW = \frac{560}{28} = 20$$

$$\text{Step (4) } SST = SSA + SSW = 240 + 560 = 800$$

$$\text{Step (5) } F_{stat} = \frac{MSA}{MSW} = \frac{80}{20} = 4$$

| Sources of variation | Degree of freedom | Sum of squares | Mean squares MS. | F-ratio |
|----------------------|-------------------|----------------|------------------|----------------|
| Among groups | 3 | SSA= 240 | MSA=80 | $F_{STAT} = 4$ |
| Within groups | 28 | SSW=560 | MSW=20 | |
| Total | 31 | SST= 800 | | |

a) At the 0.05 level of significance, state the decision rule for testing the null hypothesis that all four groups have equal population means.

Reject H_0 if $F_{stat} > 2.95$; otherwise do not reject H_0

b) What is your statistical decision?

Because $F_{stat} = 4 > 2.95$, reject H_0
