## Exercise-6-

The criteria of decision-making under uncertainty is summarized as follows:
(i) To find Optimism (Maximax ) criterion.

1. Locate the maximum payoff values corresponding to each decision alternative.
2. Select a decision alternative with best payoff value (maximum for profit).
(ii) Pessimism (Maximin ) criterion
3. Locate the minimum payoff value corresponding to each decision alternative.
4. Select a decision alternative with the best payoff value (maximum for profit).
(iii) Equal probabilities (Laplace) criterion.
5. Assign equal probability value to each state of nature by using the formula:
$1 \div$ (number of states of nature).
6. Compute the expected (or average) payoff for each alternative by adding all the payoffs and dividing by the number of possible states of nature.
7. Select the best expected payoff value (maximum for profit).
(iv) Hurwiez criterion
(i) Decide the coefficient of optimism a (alpha) and then coefficient of pessimism (1- 1 ).
(ii) For each decision alternative select the largest and lowest payoff value and multiply these with $\alpha$ and (1$\alpha)$ values, respectively. Then calculate the weighted average,
$\mathbf{D}=\alpha$ (Maximum in column) $+(1-\alpha)$ (Minimum in column)
(iii) Select an alternative with best weighted average payoff value.
(v) Minmax (salvage or Regret) criterion
8. from the given payoff matrix, develop an opportunity-loss (or regret) matrix as follows:

- Find the best payoff corresponding to each state of nature
- Subtract all other payoff values in that row from this value.

2. For each decision alternative identify the worst (maximum) payoff value. Record this value in the new row.
3. Select a decision alternative resulting in a smallest anticipated opportunity-loss value.

The criteria of DECISION-MAKING UNDER RISK is summarized as follows:
(i) Expected payoff criterion (E)

1. Construct a payoff matrix listing all possible courses of action and states of nature.
2. Calculate the EMV for each course of action by multiplying the conditional payoffs by the associated probabilities and adding these weighted values for each course of action $E M V=\sum_{i=1}^{m} r_{i j} p_{i}$
3. Select the course of action that yields the optimal EMV.
(ii) Expected Opportunity Loss (EOL)
4. Prepare a conditional payoff values matrix for each combination of course of action and state of nature along with the associated probabilities.
5. For each state of nature calculate the conditional opportunity loss (COL) values by subtracting each payoff from the maximum payoff.
6. Calculate the EOL for each course of action by multiplying the probability of each state of nature with the COL value and then adding the values.
$E M V=\sum_{i=1}^{m} L_{i j} p_{i}, L_{i j}$ : opportunity loss due to state of nature $i$ and course of action $j$
7. Select a course of action for which the EOL is minimum.
(iii) Most likelihood criterion (ML)
$M L=$ choose high probability with highest alternative payoff OR with low alternative cost.

Given the following Payoff tables: where the table represents profits :

| Alternatives | States of nature |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | S1 | S2 | S3 | S4 |
| A1 | 3 | 5 | 8 | -1 |
| A2 | 6 | 5 | 2 | 0 |
| A3 | 0 | 5 | 6 | 4 |

State which can be chosen as the best act using:
(a) Maximax, (b) Maximin, (c) Minimax regret (savage criterion),
(d) Equal likelihood (Laplace),
(e) Hurwicz Alpha criterion $\alpha=0.4$

## > Decision making under uncertainty.

a) Maximax :
$\operatorname{Max}(\operatorname{Max} A i)=\operatorname{Max}(8,6,6)=8$
Decision : Select A1
b) Maxmin :
$\operatorname{Max}(\operatorname{Min} \mathrm{Ai})=\operatorname{Max}(-1,0,0)=0$
Decision : Select A2 or A3
c) Minimax :

| Loss table |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Alternatives | States of nature |  |  |  |
|  | S1 | S2 | S3 | S4 |
| A1 | 3 | 0 | 0 | 5 |
| A2 | 0 | 0 | 6 | 4 |
| A3 | 6 | 0 | 2 | 0 |

d) Laplace:
we associate equal probability for event say say $1 / 4$
Expected pay-offs are :
$\mathrm{E}(\mathrm{A} 1)=\frac{3+5+8-1}{4}=\frac{15}{4}=3.75$
$E(A 2)=\frac{6+5+2+0}{4}=\frac{13}{4}=3.25$
$E(A 3)=\frac{0+5+6+4}{4}=\frac{15}{4}=3.75$
A1 and A3 has the maximum expected pay-off
Decision : Select A1 or A3
e) Hurwicz:
$\mathrm{D}=\alpha($ Maximum in Ai$)+(1-\alpha)($ Minimum in Ai$)$

$$
\begin{aligned}
& D(A 1)=\left(0.4^{*} 8\right)+\left(0.6^{*}-1\right)=2.6 \\
& D(A 2)=\left(0.4^{*} 6\right)+\left(0.6^{*} 0\right)=2.4 \\
& D(A 3)=\left(0.4^{*} 6\right)+\left(0.6^{*} 0\right)=2.4
\end{aligned}
$$

$D(A 1)$ has the maximum
Decision : Select A1

Given : $P(S 1)=0.6, P(S 2)=0.1, P(S 3)=0.2, P(S 4)=0.1$ in table (A) ,Find:
(f)Expected payoff criterion (E),
(g)Expected Opportunity Loss (EOL),
(k)Most likelihood criterion (ML)

| Alternatives | States of nature |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | S1 | S2 | S3 | S4 |
| A1 | 3 | 5 | 8 | -1 |
| A2 | 6 | 5 | 2 | 0 |
| A3 | 0 | 5 | 6 | 4 |
| probability | 0.6 | 0.1 | 0.2 | 0.1 |

> Decision making under Risk.
Expected payoff criterion (E)
E for A1 = (3*0.6) $+\left(5^{*} 0.1\right)+\left(8^{*} 0.2\right)+\left(-1^{*} 0.1\right)=3.8$
$E$ for A2 $=\left(6^{*} 0.6\right)+\left(5^{*} 0.1\right)+\left(2^{*} 0.2\right)+\left(0^{*} 0.1\right)=4.5$
$E$ for $A 3=\left(0^{*} 0.6\right)+\left(5^{\star} 0.1\right)+\left(6^{*} 0.2\right)+\left(4^{\star} 0.1\right)=2.1$

E for A2 is greater
Decision : Select A2
f) Expected Opportunity Loss (EOL),

| Loss table | States of nature |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Alternatives |  |  |  |  |
|  | S1 | S2 | S3 | S4 |
| A1 | 3 | 0 | 0 | 5 |
| A2 | 0 | 0 | 6 | 4 |
| A3 | 6 | 0 | 2 | 0 |
| probability | 0.6 | 0.1 | 0.2 | 0.1 |

ELO for A1 $=\left(3^{*} 0.6\right)+(0 * 0.1)+\left(0^{*} 0.2\right)+\left(5^{*} 0.1\right)=2.3$
ELO for A2 $=\left(0^{*} 0.6\right)+\left(0^{*} 0.1\right)+\left(6^{*} 0.2\right)+\left(4^{*} 0.1\right)=1.6$
ELO for A3 $=(6 * 0.6)+(0 * 0.1)+\left(2^{*} 0.2\right)+(0 * 0.1)=4$

ELO for A2 is least
Decision : Select A2
g) Most likelihood criterion (ML)

High probability is $\mathrm{P} 1=0.6$ with the high payoff at $\mathrm{A} 2=6$

Decision : Select A2
(H.W)

Example: An agricultural company wants to decide which commodity should stock to get maximum profit. It was supplied with the following information. The probability that the monsoon will be excess, normal and deficient is $\mathbf{0 . 4 0 , 0 . 3 0}$ and $\mathbf{0 . 3 0}$. The estimated profit or loss three commodities in respect of these different kinds of monsoon are:

| Profit per 1 ton |  |  |  |
| :--- | :--- | :--- | :--- |
| Monsoon | Excess | Normal | Deficient |
| Rice | 10,000 | $-4,000$ | 15,000 |
| Wheat | 4,000 | $-3,000$ | 8,000 |
| Maize | 4,000 | 1,000 | $-1,000$ |

Determine the optimal decision under each of the following decision criteria and show how you arrived at it:
(a) Maximax, (b) Maximin, (c) Minimax regret (savage criterion), (d) Equal likelihood (Laplace), (e) Hurwicz Alpha criterion $\alpha=0.8$, (f)E, (g)EOL, (k)ML .

## Decision making under uncertainty.

1. Maximax criterion (OPTIMISM)

| Alternative <br> Monsoon | Rice | Wheat | Maize |
| :---: | :---: | :---: | :---: |
| Excess | 10,000 | 4,000 | 4,000 |
| Normal | -4,000 | -3,000 | 1,000 |
| Deficient | 15,000 | 8,000 | -1,000 |
| MAX | 15,000 | 8,000 | 4,000 |

The maximum of column maxima is 15,000 . Hence, the company should adopt Rice commodity.
2. Maximin criterion (pessimism).

| Alternative <br> Monsoon | Rice | Wheat | Maize |
| :---: | :---: | :---: | :---: |
| Excess | 10,000 | 4,000 | 4,000 |
| Normal | -4,000 | -3,000 | 1,000 |
| Deficient | 15,000 | 8,000 | -1,000 |
| Min | -4,000 | -3,000 | -1,000 |

The maximum of column minima is $-1,000$. Hence, the company should adopt Maize commodity.
3. Minimax regret.

| Alternative |  | Rice | Wheat |
| :--- | :--- | :--- | :--- |
| Monsoon |  | Maize |  |
| Excess | 10,000 | 4,000 | 4,000 |
| Normal | $-4,000$ | $-3,000$ | 1,000 |
| Deficient | 15,000 | 8,000 | $-1,000$ |

Note: From the given payoff matrix, develop an opportunity-loss (or regret) matrix as follows: (i) Find the best payoff corresponding to each state of nature
(ii) Subtract all other payoff values in that row from this value.

Opportunity Loss Table

| Alternative <br> Monsoon | Rice | Wheat | Maize |
| :--- | :--- | :--- | :--- |
| Excess | $10,000-10,000=$ | $10,000-4,000=$ | $10,000-4,000=$ |
|  | 0 | 6,000 | 6,000 |
| Normal | $1,000-(-4,000)=$ | $1,000-(-3,000)=$ | $1,000-1,000=$ |
|  | 5,000 | 4,000 | 0 |
| Deficient | $15,000-15,000=$ | $15,000-8,000=$ | $15,000-(-1,000)=$ |
|  | 0 | 7,000 | 16,000 |
| MAX | $\mathbf{5 , 0 0 0}$ | $\mathbf{7 , 0 0 0}$ | $\mathbf{1 6 , 0 0 0}$ |

Decision: Rice
4. Equal likelihood (Laplace).

| Alternative <br> Monsoon | Rice | Wheat | Maize |
| :---: | :---: | :---: | :---: |
| Excess | 10,000 | 4,000 | 4,000 |
| Normal | -4,000 | -3,000 | 1,000 |
| Deficient | 15,000 | 8,000 | -1,000 |
| Expected (average) | $\begin{aligned} & \frac{1}{3}(10,000 \\ & -4,000 \\ & +15,000) \\ & =7000 \end{aligned}$ | $\begin{gathered} \frac{1}{3}(4,000-3,000 \\ +8,000) \\ =3000 \end{gathered}$ | $\begin{aligned} & \frac{1}{3}(4,000-1,000 \\ & +1,000) \\ & \quad=1333.33 \end{aligned}$ |

Decision: Rice

## 5. Hurwicz Alpha criterion $\alpha=0.8$.

| Alternative <br> Monsoon | Rice | Wheat | Maize |
| :---: | :---: | :---: | :---: |
| Excess | 10,000 | 4,000 | 4,000 |
| Normal | -4,000 | -3,000 | 1,000 |
| Deficient | 15,000 | 8,000 | -1,000 |
| weighted average: $\mathrm{D}_{\mathrm{i}}$ | $\begin{aligned} & 0.8(15,000)+0.2(- \\ & 4,000)=11,200 \end{aligned}$ | $\begin{aligned} & 0.8(8,0000+0.2(- \\ & 3,000)=5,800 \end{aligned}$ | $\begin{aligned} & \hline 0.8 * 4,000+0.2(- \\ & 1,000)=3000 \end{aligned}$ |

$D=\alpha($ Maximum in column $)+(1-\alpha)($ Minimum in column $)$
Decision: Rice

## Decision making under Risk.

1. Expected payoff criterion (E) .

| Alternative <br> Monsoon | Rice | Wheat | Maize | probability |
| :--- | :--- | :--- | :--- | :--- |
| Excess | 10,000 | 4,000 | 4,000 | 0.4 |
| Normal | $-4,000$ | $-3,000$ | 1,000 | 0.30 |
| Deficient | 15,000 | 8,000 | $-1,000$ | 0.30 |
| E | $0.4(10,000)+0.3(-$ | $0.4(4,000)+0.3(-$ | $0.4(4,000)+0.3(-$ |  |
|  | $4,000)+0.3(15,000)=$ | $3,000)+0.3(8,000)=$ <br> 7100 | $1,000)+0.3(1,000)=$ |  |
|  | 7300 | 1600 |  |  |

Decision: Rice
2. Expected Opportunity Loss (EOL).

Opportunity Loss Table

| Altennative <br> Monsoon | Rice | Wheat | Maize | probability |
| :--- | :--- | :--- | :--- | :--- |
| Excess | 0 | 6,000 | 6,000 | 0.4 |
| Normal | 5,000 | 4,000 | 0 | 0.30 |
| Deficient | 0 | 7,000 | 16,000 | 0.30 |
| EOL | $0.3(5,000)$ <br> $=1,500$ | $0.4(6,000)+0.3(4,000)+0.3(7,000)$ <br> $=5,700$ | $0.4(6,000)+0.3(16,000)$ <br> $=7,200$ |  |

Decision: Rice
3. Most likelihood criterion (ML)

| Alternative <br> Monsonn | Rice | Wheat | Maize | probability |
| :--- | :--- | :--- | :--- | :--- |
| Excess | 10,000 | 4,000 | 4,000 | 0.4 |
| Normal | $-4,000$ | $-3,000$ | 1,000 | 0.30 |
| Deficient | 15,000 | 8,000 | $-1,000$ | 0.30 |

$M L$ with high probability is $\mathrm{P} 1=0.4$ at $\mathrm{A}=$ rice with payoff $=10,000$
Decision: Rice
