#### Exercise-9-

## Given the following Payoff tables: where the table represents profits:

| Alternatives | States of nature |    |    |    |
|--------------|------------------|----|----|----|
|              | S1               | S2 | S3 | S4 |
| A1           | 3                | 5  | 8  | -1 |
| A2           | 6                | 5  | 2  | 0  |
| A3           | 0                | 5  | 6  | 4  |

## State which can be chosen as the best act using:

- (a) Maximax, (b) Maximin, (c) Minimax regret (savage criterion),
- (d) Equal likelihood (Laplace),
- (e) Hurwicz Alpha criterion  $\alpha$ =0.4

# > Decision making under uncertainty.

## a) Maximax:

Max(Max Ai) = Max(8, 6, 6) = 8

**Decision : Select A1** 

## b) Maxmin:

Max(Min Ai) = Max (-1, 0, 0) = 0

**Decision:** Select A2 or A3

# c) Minimax:

| Loss table   |           |           |           |           |
|--------------|-----------|-----------|-----------|-----------|
| Alternatives |           | States of | nature    |           |
|              | <b>S1</b> | <b>S2</b> | <b>S3</b> | <b>S4</b> |
| A1           | 3         | 0         | 0         | 5         |
| A2           | 0         | 0         | 6         | 4         |
| А3           | 6         | 0         | 2         | 0         |

Min(Max Ai) = Min(5, 6, 6) = 5

Decision : Select A1

# d) Laplace:

we associate equal probability for event say say 1/4

**Expected pay-offs are:** 

$$E(A1) = \frac{3+5+8-1}{4} = \frac{15}{4} = 3.75$$

$$E(A2) = \frac{6+5+2+0}{4} = \frac{13}{4} = 3.25$$

$$E(A3) = \frac{0+5+6+4}{4} = \frac{15}{4} = 3.75$$

A1 and A3 has the maximum expected pay-off

**Decision : Select A1 or A3** 

## e) Hurwicz:

 $D=\alpha$  (Maximum in Ai) +  $(1 - \alpha)$  (Minimum in Ai)

$$D(A1)=(0.4*8)+(0.6*-1)=2.6$$

$$D(A2)=(0.4*8)+(0.6*0)=2.4$$

$$D(A3)=(0.4*6)+(0.6*0)=2.4$$

D(A1) has the maximum

Decision : Select A1

Given: P(S1)=0.6, P(S2)=0.1, P(S3)=0.2, P(S4)=0.1 in table (A), Find:

(f)Expected Monetary Value (EMV),

(g)Expected Opportunity Loss (EOL),

(k)Expected Value of Perfect Information (EVPI)

| Alternatives | States of nature |           |           |           |
|--------------|------------------|-----------|-----------|-----------|
|              | <b>S1</b>        | <b>S2</b> | <b>S3</b> | <b>S4</b> |
| A1           | 3                | 5         | 8         | -1        |
| A2           | 6                | 5         | 2         | 0         |
| A3           | 0                | 5         | 6         | 4         |
| probability  | 0.6              | 0.1       | 0.2       | 0.1       |

# > Decision making under Risk.

f) Expected Monetary Value (EMV)

EMV for A1 = (3\*0.6)+(5\*0.1)+(8\*0.2)+(-1\*0.1)=3.8

EMV for A2 = (6\*0.6)+(5\*0.1)+(2\*0.2)+(0\*0.1)=4.5

EMV for A3 = (0\*0.6)+(5\*0.1)+(6\*0.2)+(4\*0.1)=2.1

**EMV** for A2 is greater

**Decision : Select A2** 

## g) Expected Opportunity Loss (EOL),

| Loss table   |           |           |           |           |
|--------------|-----------|-----------|-----------|-----------|
| Alternatives |           | States of | nature    |           |
|              | <b>S1</b> | <b>S2</b> | <b>S3</b> | <b>S4</b> |
| A1           | 3         | 0         | 0         | 5         |
| A2           | 0         | 0         | 6         | 4         |
| А3           | 6         | 0         | 2         | 0         |
| probability  | 0.6       | 0.1       | 0.2       | 0.1       |

ELO for A1 = 
$$(3*0.6)+(0*0.1)+(0*0.2)+(5*0.1)=2.3$$
  
ELO for A2 =  $(0*0.6)+(0*0.1)+(6*0.2)+(4*0.1)=1.6$ 

ELO for A3 = 
$$(6*0.6)+(0*0.1)+(2*0.2)+(0*0.1)=4$$

EMV for A2 is least Decision : Select A2

## h) Expected Value of Perfect Information (EVPI)

|            | Max. profit of each state (S)           | probability | Expected value (= prob. * profit) |
|------------|---|-------------|-----------------------------------|
| S1         | 6                                       | 0.6         | 3.6                               |
| S2         | 5                                       | 0.1         | 0.5                               |
| <b>S</b> 3 | 8                                       | 0.2         | 1.6                               |
| <b>S4</b>  | 4                                       | 0.1         | 0.4                               |
| Ex         | Sum<br>spected profit wit<br>informatio | 6.1         |                                   |

EVPI = Expected profit with perfect information – max EMV

#### (H.W)

**Example**: An agricultural company wants to decide which commodity should stock to get maximum profit. It was supplied with the following information. The probability that the monsoon will **be excess, normal and deficient is 0.40,0.30 and 0.30**. The estimated profit or loss three commodities in respect of these different kinds of monsoon are:

| <b>Profit</b> per 1 ton         |        |        |        |  |
|---------------------------------|--------|--------|--------|--|
| Monsoon Excess Normal Deficient |        |        |        |  |
| Rice                            | 10,000 | -4,000 | 15,000 |  |
| Wheat                           | 4,000  | -3,000 | 8,000  |  |
| Maize                           | 4,000  | 1,000  | -1,000 |  |

Determine the optimal decision under each of the following decision criteria and show how you arrived at it:

(a) Maximax, (b) Maximin, (c) Minimax regret (savage criterion), (d) Equal likelihood (Laplace), (e) Hurwicz Alpha criterion  $\alpha$ =0.8, (f)EMV, (g)EOL, (k)EVPI.

## > Decision making under uncertainty.

#### 1. Maximax criterion (OPTIMISM)

| 17 17100111011 (01 11171120171) |        |        |        |  |
|---------------------------------|--------|--------|--------|--|
| Alternative                     | Rice   | Wheat  | Maize  |  |
| Monsoon                         |        |        |        |  |
| Excess                          | 10,000 | 4,000  | 4,000  |  |
| Normal                          | -4,000 | -3,000 | 1,000  |  |
| Deficient                       | 15,000 | 8,000  | -1,000 |  |
| MAX                             | 15,000 | 8,000  | 4,000  |  |

The maximum of column maxima is 15,000. Hence, the company should adopt Rice commodity.

#### 2. Maximin criterion (pessimism).

| Alternative | Rice   | Wheat  | Maize         |
|-------------|--------|--------|---------------|
| Monsoon     |        |        |               |
| Excess      | 10,000 | 4,000  | 4,000         |
| Normal      | -4,000 | -3,000 | 1,000         |
| Deficient   | 15,000 | 8,000  | -1,000        |
| Min         | -4,000 | -3,000 | <b>-1,000</b> |

The maximum of column minima is -1,000. Hence, the company should adopt Maize commodity.

#### 3. Minimax regret.

| Alternative | Rice   | Wheat  | Maize  |
|-------------|--------|--------|--------|
| Monsoon     |        |        |        |
| Excess      | 10,000 | 4,000  | 4,000  |
| Normal      | -4,000 | -3,000 | 1,000  |
| Deficient   | 15,000 | 8,000  | -1,000 |

Note: From the given payoff matrix, develop an opportunity-loss (or regret) matrix as follows:

- (i) Find the best payoff corresponding to each state of nature
- (ii) Subtract all other payoff values in that row from this value.

Opportunity Loss Table

| Alternative | Rice            | Wheat            | Maize            |
|-------------|-----------------|------------------|------------------|
| Monsoon     |                 |                  |                  |
| Excess      | 10,000-10,000=  | 10,000-4,000=    | 10,000-4,000=    |
|             | 0               | 6,000            | 6,000            |
| Normal      | 1,000-(-4,000)= | 1,000-(-3,000) = | 1,000-1,000=     |
|             | 5,000           | 4,000            | 0                |
| Deficient   | 15,000-15,000=  | 15,000-8,000 =   | 15,000-(-1,000)= |
|             | 0               | 7,000            | 16,000           |
| MAX         | 5,000           | 7,000            | 16,000           |

Decision: Rice

# 4. Equal likelihood (Laplace).

| Alternative        | Rice  | Wheat                                       | Maize  |
|--------------------|---|---|--|
| Monsoon            |   |   |  |
| Excess             | 10,000  | 4,000                                       | 4,000  |
| Normal             | -4,000  | -3,000                                      | 1,000  |
| Deficient          | 15,000  | 8,000                                       | -1,000   |
| Expected (average) | $ \frac{1}{3}(10,000 \\ -4,000 \\ +15,000) \\ =7000 $ | $\frac{1}{3}(4,000 - 3,000 + 8,000) = 3000$ | $\frac{1}{3}(4,000 - 1,000 + 1,000) = 1333.33$ |

Decision: Rice

# 5. Hurwicz Alpha criterion $\alpha$ =0.8.

| Alternative             | Rice                        | Wheat            | Maize           |
|-------------------------|-----------------------------|------------------|-----------------|
| Monsoon                 |                             |                  |                 |
| Excess                  | 10,000                      | 4,000            | 4,000           |
| Normal                  | -4,000                      | -3,000           | 1,000           |
| Deficient               | 15,000                      | 8,000            | -1,000          |
| weighted                | 0.8(15,000)+0.2(-           | 0.8(8,0000+0.2(- | 0.8*4,000+0.2(- |
| average: D <sub>i</sub> | 4,000)= <mark>11,200</mark> | 3,000)= 5,800    | 1,000)= 3000    |

 $D=\alpha$  (Maximum in column) + (1 -  $\alpha$ )(Minimum in column)

Decision: Rice

# > Decision making under Risk.

1. Expected monetary value (EMV).

| Alternative | Rice                | Wheat              | Maize              | probability |
