CSC113 – Computer Programming II – Lab Exam – Spring 2017

Shape:

- **Shape(id : int)** - constructor.
- **display()** – this method prints all attributes in **Shape**, **Circle** and **Square**.
- **calculateArea()** – this method calculates and returns the area of the shape as follows:
 - **Square:** side * side
 - **Circle:** radius * radius * 3.14

Square:

- **Square(id : int, side : int)** - constructor.
- **getSide()** – getter for attribute **side**.

Circle:

- **Circle(id : int, radius : int)** – constructor.
- **getRadius()** – getter for attribute **radius**.

Scene:

- **Scene(name : String, size : int)** - constructor
- **addShape(s : Shape)** – this method adds a new shape to the array
- **getCircles(r : int)** – this method will return an array of **circles** with radius larger than r.
- **search(id : int, i : int)** – this method searches for the shape with the given id and returns the index **recursively**. (Hint: use *i* as a counter. If you find it, return it. Otherwise check the next index)

Translate to java all classes in the UML.
