Differential Equations of Order One

Dr. Bander Almutairi

King Saud University

5 Feb 014

Example:

$$(x-c)^2+(y-c)^2=2c^2. \tag{1}$$

represents a family of circles with their centers on $y=x$. If we assume that c in the equation (1) is arbitrary constant, then by using the elimination of arbitrary constant, then result equation is called *differential equation of the family of curve (1)*.

Example:

$$(x-c)^2+(y-c)^2=2c^2. \tag{1}$$

represents a family of circles with their centers on $y=x$. If we assume that c in the equation (1) is arbitrary constant, then by using the elimination of arbitrary constant, then result equation is called *differential equation of the family of curve (1)*.

We can rearrange equation (1) to be the following

$$x^2+y^2-2c(x+y)=0.$$

Example:

$$(x-c)^2+(y-c)^2=2c^2. \tag{1}$$

represents a family of circles with their centers on $y=x$. If we assume that c in the equation (1) is arbitrary constant, then by using the elimination of arbitrary constant, then result equation is called *differential equation of the family of curve (1)*.
We can rearrange equation (1) to be the following

$$x^2+y^2-2c(x+y)=0.$$

So we get

$$\frac{x^2+y^2}{x+y}=2c, y\neq -x.$$

Q(1): Find a differential equation satisfied by the family of parabolas having their virtices at the origin and their foci (focus) on the y-axis.
Q(2): Find the differential equation of the family of circles having their centers on the y-axis.

Theorem

For a first order differential equation (IVP)

$$\begin{aligned} \frac{dy}{dx} &= f(x, y) \\ y(x_0) &= y_0, \end{aligned}$$

there exists a unique solution if

Theorem

For a first order differential equation (IVP)

$$\begin{aligned} \frac{dy}{dx} &= f(x,y) \\ y(x_0) &= y_0, \end{aligned}$$

there exists a unique solution if

- $f(x,y)$ *and* $\frac{\partial f(x,y)}{\partial y}$ *are continous with in the region* $\mathbb{R}^2$ *of xy-plane.*

Theorem

For a first order differential equation (IVP)

$$\begin{aligned} \frac{dy}{dx} &= f(x,y) \\ y(x_0) &= y_0, \end{aligned}$$

there exists a unique solution if

- $f(x,y)$ *and* $\frac{\partial f(x,y)}{\partial y}$ *are continous with in the region* $\mathbb{R}^2$ *of xy-plane.*
- (x_0, y_0) *be a point in the region* $\mathbb{R}^2$*.*

Theorem

For a first order differential equation (IVP)

$$\begin{aligned} \frac{dy}{dx} &= f(x,y) \\ y(x_0) &= y_0, \end{aligned}$$

there exists a unique solution if

- $f(x,y)$ *and* $\frac{\partial f(x,y)}{\partial y}$ *are continous with in the region* $\mathbb{R}^2$ *of xy-plane.*
- (x_0, y_0) *be a point in the region* $\mathbb{R}^2$.

Q: Find the largest region of the xy-plane for which the following initial value problems have unique solutions:

(a) $\sqrt{x^2-4}y' = 1 + \sin(x)\ln(y)$, with initial condition $y(3) = 4$.

(b) $\ln(x-2).\frac{dy}{dx} = \sqrt{y-2}$, with initial condition $y(\frac{5}{2}) = 4$.

(c) $\sqrt{\frac{x}{y}}y' = \cos(x+y); y \neq 0$, with initial condition $y(1) = 1$.

Consider a first-order differential equation of the form:

$$M(x, y)dx + N(x, y)dy = 0, \tag{2}$$

where M and N are two function of x, y.

Consider a first-order differential equation of the form:

$$M(x,y)dx + N(x,y)dy = 0, \tag{2}$$

where M and N are two function of x, y. Sometimes we can write the equation (2) as follows:

$$F(x)dx + G(y)dy = 0, \tag{3}$$

the variables separated here and we can find a solution immediately.

Q(i): Find a solution for each of the following:

(a) $2x(y^2 + y)dx + (x^2 - 1)ydy = 0; y \neq 0.$

(b) $(xy + 1)dx = (x^2y^2 + x^2 + y^2 + 1)dy.$

Q(ii): Solve the following IVP

$$e^y \frac{dy}{dx} = \cos(2x) + 2e^y \sin^2(x) - 1; y(\frac{\pi}{2}) = \ln(2).$$
