# Matrices and Determinants

- 1.1 Matrices
- 1.2 Operations of matrices
- 1.3 Types of matrices
- 1.4 Properties of matrices
- 1.5 Determinants
- 1.6 Inverse of a  $3 \times 3$  matrix

# 1.1 Matrices

$$A = \begin{bmatrix} 2 & 3 & 7 \\ 1 & -1 & 5 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 & 3 & 1 \\ 2 & 1 & 4 \\ 4 & 7 & 6 \end{bmatrix}$$

Both  $A$  and  $B$  are examples of matrix. A matrix is a rectangular array of numbers enclosed by a pair of bracket.

Why matrix?

# 1.1 Matrices

Consider the following set of equations:

$$\begin{cases} x + y = 7, \\ 3x - y = 5. \end{cases} \quad \text{It is easy to show that } x = 3 \text{ and } y = 4.$$

How about solving

$$\begin{cases} x + y - 2z = 7, \\ 2x - y - 4z = 2, \\ -5x + 4y + 10z = 1, \\ 3x - y - 6z = 5. \end{cases}$$

Matrices can help...

# 1.1 Matrices

In the matrix

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & & a_{2n} \\ \vdots & & \ddots & \\ a_{m1} & a_{m2} & & a_{mn} \end{bmatrix}$$

- numbers  $a_{ij}$  are called *elements*. First subscript indicates the row; second subscript indicates the column. The matrix consists of  $mn$  elements
- It is called "the  $m \times n$  matrix  $A = [a_{ij}]$ " or simply "the matrix  $A$ " if number of rows and columns are understood.

# 1.1 Matrices

## Square matrices

- When  $m = n$ , i.e.,  
$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & & a_{2n} \\ \vdots & & \ddots & \\ a_{n1} & a_{n2} & & a_{nn} \end{bmatrix}$$
- $A$  is called a "square matrix of order  $n$ " or " $n$ -square matrix"
- elements  $a_{11}, a_{22}, a_{33}, \dots, a_{nn}$  called diagonal elements.
- $\sum_{i=1}^n a_{ii} = a_{11} + a_{22} + \dots + a_{nn}$  is called the *trace* of  $A$ .

# 1.1 Matrices

## Equal matrices

- Two matrices  $A = [a_{ij}]$  and  $B = [b_{ij}]$  are said to be equal ( $A = B$ ) iff each element of  $A$  is equal to the corresponding element of  $B$ , i.e.,  $a_{ij} = b_{ij}$  for  $1 \leq i \leq m, 1 \leq j \leq n$ .
- iff* pronouns "if and only if"
  - if  $A = B$ , it implies  $a_{ij} = b_{ij}$  for  $1 \leq i \leq m, 1 \leq j \leq n$ ;
  - if  $a_{ij} = b_{ij}$  for  $1 \leq i \leq m, 1 \leq j \leq n$ , it implies  $A = B$ .

# 1.1 Matrices

## Equal matrices

Example:  $A = \begin{bmatrix} 1 & 0 \\ -4 & 2 \end{bmatrix}$  and  $B = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Given that  $A = B$ , find  $a, b, c$  and  $d$ .

if  $A = B$ , then  $a = 1, b = 0, c = -4$  and  $d = 2$ .

# 1.1 Matrices

## Zero matrices

- Every element of a matrix is zero, it is called a zero matrix, i.e.,

$$A = \begin{bmatrix} 0 & 0 & \dots & 0 \\ 0 & 0 & & 0 \\ \vdots & & \ddots & \\ 0 & 0 & & 0 \end{bmatrix}$$

# 1.2 Operations of matrices

## Sums of matrices

- If  $A = [a_{ij}]$  and  $B = [b_{ij}]$  are  $m \times n$  matrices, then  $A + B$  is defined as a matrix  $C = A + B$ , where  $C = [c_{ij}]$ ,  $c_{ij} = a_{ij} + b_{ij}$  for  $1 \leq i \leq m$ ,  $1 \leq j \leq$

$n$ .  
Example: if  $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \end{bmatrix}$  and  $B = \begin{bmatrix} 2 & 3 & 0 \\ -1 & 2 & 5 \end{bmatrix}$

Evaluate  $A + B$  and  $A - B$ .

$$A + B = \begin{bmatrix} 1+2 & 2+3 & 3+0 \\ 0+(-1) & 1+2 & 4+5 \end{bmatrix} = \begin{bmatrix} 3 & 5 & 3 \\ -1 & 3 & 9 \end{bmatrix}$$

$$A - B = \begin{bmatrix} 1-2 & 2-3 & 3-0 \\ 0-(-1) & 1-2 & 4-5 \end{bmatrix} = \begin{bmatrix} -1 & -1 & 3 \\ 1 & -1 & -1 \end{bmatrix}$$

## 1.2 Operations of matrices

### Sums of matrices

- Two matrices of the same order are said to be *conformable* for addition or subtraction.
- Two matrices of different orders cannot be added or subtracted, e.g.,

$$\begin{bmatrix} 2 & 3 & 7 \\ 1 & -1 & 5 \end{bmatrix} \quad \begin{bmatrix} 1 & 3 & 1 \\ 2 & 1 & 4 \\ 4 & 7 & 6 \end{bmatrix}$$

are NOT conformable for addition or subtraction.

## 1.2 Operations of matrices

### Scalar multiplication

- Let  $\lambda$  be any scalar and  $A = [a_{ij}]$  is an  $m \times n$  matrix. Then  $\lambda A = [\lambda a_{ij}]$  for  $1 \leq i \leq m, 1 \leq j \leq n$ , i.e., each element in  $A$  is multiplied by  $\lambda$ .

Example:  $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \end{bmatrix}$ . Evaluate  $3A$ .

$$3A = \begin{bmatrix} 3 \times 1 & 3 \times 2 & 3 \times 3 \\ 3 \times 0 & 3 \times 1 & 3 \times 4 \end{bmatrix} = \begin{bmatrix} 3 & 6 & 9 \\ 0 & 3 & 12 \end{bmatrix}$$

- In particular,  $\lambda = -1$ , i.e.,  $-A = [-a_{ij}]$ . It's called the *negative* of  $A$ . Note:  $A - A = 0$  is a zero matrix

## 1.2 Operations of matrices

### Properties

Matrices  $A$ ,  $B$  and  $C$  are conformable,

- $A + B = B + A$  (commutative law)
- $A + (B + C) = (A + B) + C$  (associative law)
- $\lambda(A + B) = \lambda A + \lambda B$ , where  $\lambda$  is a scalar (distributive law)

Can you prove them?

## 1.2 Operations of matrices

### Properties

Example: Prove  $\lambda(A + B) = \lambda A + \lambda B$ .

Let  $C = A + B$ , so  $c_{ij} = a_{ij} + b_{ij}$ .

Consider  $\lambda c_{ij} = \lambda (a_{ij} + b_{ij}) = \lambda a_{ij} + \lambda b_{ij}$ , we have,  
 $\lambda C = \lambda A + \lambda B$ .

Since  $\lambda C = \lambda(A + B)$ , so  $\lambda(A + B) = \lambda A + \lambda B$

# 1.2 Operations of matrices

## Matrix multiplication

- If  $A = [a_{ij}]$  is a  $m \times p$  matrix and  $B = [b_{ij}]$  is a  $p \times n$  matrix, then  $AB$  is defined as a  $m \times n$  matrix  $C = AB$ , where  $C = [c_{ij}]$  with

$$c_{ij} = \sum_{k=1}^p a_{ik} b_{kj} = a_{i1} b_{1j} + a_{i2} b_{2j} + \dots + a_{ip} b_{pj} \text{ for } 1 \leq i \leq m, 1 \leq j \leq n.$$

Example:  $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \end{bmatrix}$ ,  $B = \begin{bmatrix} -1 & 2 \\ 2 & 3 \\ 5 & 0 \end{bmatrix}$  and  $C = AB$ .

Evaluate  $c_{21}$ .

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \end{bmatrix} \begin{bmatrix} -1 & 2 \\ 2 & 3 \\ 5 & 0 \end{bmatrix} \quad c_{21} = 0 \times (-1) + 1 \times 2 + 4 \times 5 = 22$$

# 1.2 Operations of matrices

## Matrix multiplication

Example:  $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \end{bmatrix}$ ,  $B = \begin{bmatrix} -1 & 2 \\ 2 & 3 \\ 5 & 0 \end{bmatrix}$ , Evaluate  $C = AB$ .

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \end{bmatrix} \begin{bmatrix} -1 & 2 \\ 2 & 3 \\ 5 & 0 \end{bmatrix} \Rightarrow \begin{cases} c_{11} = 1 \times (-1) + 2 \times 2 + 3 \times 5 = 18 \\ c_{12} = 1 \times 2 + 2 \times 3 + 3 \times 0 = 8 \\ c_{21} = 0 \times (-1) + 1 \times 2 + 4 \times 5 = 22 \\ c_{22} = 0 \times 2 + 1 \times 3 + 4 \times 0 = 3 \end{cases}$$

$$C = AB = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \end{bmatrix} \begin{bmatrix} -1 & 2 \\ 2 & 3 \\ 5 & 0 \end{bmatrix} = \begin{bmatrix} 18 & 8 \\ 22 & 3 \end{bmatrix}$$

## 1.2 Operations of matrices

### Matrix multiplication

- In particular,  $A$  is a  $1 \times m$  matrix and  $B$  is a  $m \times 1$  matrix, i.e.,

$$A = [a_{11} \quad a_{12} \quad \dots \quad a_{1m}] \quad B = \begin{bmatrix} b_{11} \\ b_{21} \\ \vdots \\ b_{m1} \end{bmatrix}$$

then  $C = AB$  is a scalar.  $C = \sum_{k=1}^m a_{1k} b_{k1} = a_{11}b_{11} + a_{12}b_{21} + \dots + a_{1m}b_{m1}$

## 1.2 Operations of matrices

### Matrix multiplication

- BUT  $BA$  is a  $m \times m$  matrix!

$$BA = \begin{bmatrix} b_{11} \\ b_{21} \\ \vdots \\ b_{m1} \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1m} \end{bmatrix} = \begin{bmatrix} b_{11}a_{11} & b_{11}a_{12} & \dots & b_{11}a_{1m} \\ b_{21}a_{11} & b_{21}a_{12} & \dots & b_{21}a_{1m} \\ \vdots & \vdots & \ddots & \vdots \\ b_{m1}a_{11} & b_{m1}a_{12} & \dots & b_{m1}a_{1m} \end{bmatrix}$$

- So  $AB \neq BA$  in general !

# 1.2 Operations of matrices

## Properties

Matrices  $A$ ,  $B$  and  $C$  are conformable,

- $A(B + C) = AB + AC$

- $(A + B)C = AC + BC$

- $A(BC) = (AB)C$

- $AB \neq BA$  in general

- $AB = 0$  NOT necessarily imply  $A = 0$  or  $B = 0$

- $AB = AC$  NOT necessarily imply  $B = C$

However

# 1.2 Operations of matrices

## Properties

Example: Prove  $A(B + C) = AB + AC$  where  $A$ ,  $B$  and  $C$  are  $n$ -square matrices

Let  $X = B + C$ , so  $x_{ij} = b_{ij} + c_{ij}$ . Let  $Y = AX$ , then

$$\begin{aligned} y_{ij} &= \sum_{k=1}^n a_{ik} x_{kj} = \sum_{k=1}^n a_{ik} (b_{kj} + c_{kj}) \\ &= \sum_{k=1}^n (a_{ik} b_{kj} + a_{ik} c_{kj}) = \sum_{k=1}^n a_{ik} b_{kj} + \sum_{k=1}^n a_{ik} c_{kj} \end{aligned}$$

So  $Y = AB + AC$ ; therefore,  $A(B + C) = AB + AC$

## 1.3 Types of matrices

- Identity matrix
- The inverse of a matrix
- The transpose of a matrix
- Symmetric matrix
- Orthogonal matrix

## 1.3 Types of matrices

### Identity matrix

- A square matrix whose elements  $a_{ij} = 0$ , for  $i > j$  is called upper triangular, i.e.,

$$\begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ 0 & a_{22} & & a_{2n} \\ \vdots & & \ddots & \\ 0 & 0 & & a_{nn} \end{bmatrix}$$

- A square matrix whose elements  $a_{ij} = 0$ , for  $i < j$  is called lower triangular, i.e.,

$$\begin{bmatrix} a_{11} & 0 & \dots & 0 \\ a_{21} & a_{22} & & 0 \\ \vdots & & \ddots & \\ a_{n1} & a_{n2} & & a_{nn} \end{bmatrix}$$

## 1.3 Types of matrices

### Identity matrix

- Both upper and lower triangular, i.e.,  $a_{ij} = 0$ , for  $i \neq j$ , i.e.,

$$D = \begin{bmatrix} a_{11} & 0 & \dots & 0 \\ 0 & a_{22} & & 0 \\ \vdots & & \ddots & \\ 0 & 0 & & a_{nn} \end{bmatrix}$$

is called a diagonal matrix, simply

$$D = \text{diag}[a_{11}, a_{22}, \dots, a_{nn}]$$

# 1.3 Types of matrices

## Identity matrix

- In particular,  $a_{11} = a_{22} = \dots = a_{nn} = 1$ , the matrix is called identity matrix.

- Properties:  $AI = IA = A$

Examples of identity matrices:  $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$  and  $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

## 1.3 Types of matrices

### Special square matrix

- $AB \neq BA$  in general. However, if two square matrices  $A$  and  $B$  such that  $AB = BA$ , then  $A$  and  $B$  are said to be *commute*.

Can you suggest two matrices that must commute with a square matrix  $A$ ?

Ans:  $A$  itself, the identity matrix, ..

- If  $A$  and  $B$  such that  $AB = -BA$ , then  $A$  and  $B$  are said to be *anti-commute*.

## 1.3 Types of matrices

### The inverse of a matrix

- If matrices  $A$  and  $B$  such that  $AB = BA = I$ , then  $B$  is called the inverse of  $A$  (symbol:  $A^{-1}$ ); and  $A$  is called the inverse of  $B$  (symbol:  $B^{-1}$ ).

Example:  $A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 3 & 3 \\ 1 & 2 & 4 \end{bmatrix}$       $B = \begin{bmatrix} 6 & -2 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix}$

Show  $B$  is the the inverse of matrix  $A$ .

Ans: Note that  $AB = BA = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

Can you show the details?

## 1.3 Types of matrices

### The transpose of a matrix

- The matrix obtained by interchanging the rows and columns of a matrix  $A$  is called the transpose of  $A$  (write  $A^T$ ).

Example:  $A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$

The transpose of  $A$  is  $A^T = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$

- For a matrix  $A = [a_{ij}]$ , its transpose  $A^T = [b_{ij}]$ , where  $b_{ij} = a_{ji}$ .

## 1.3 Types of matrices

### Symmetric matrix

- A matrix  $A$  such that  $A^T = A$  is called symmetric, i.e.,  $a_{ji} = a_{ij}$  for all  $i$  and  $j$ .
- $A + A^T$  must be symmetric. Why?

Example:  $A = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & -5 \\ 3 & -5 & 6 \end{bmatrix}$  is symmetric.

- A matrix  $A$  such that  $A^T = -A$  is called skew-symmetric, i.e.,  $a_{ji} = -a_{ij}$  for all  $i$  and  $j$ .
- $A - A^T$  must be skew-symmetric. Why?

# 1.3 Types of matrices

## Orthogonal matrix

- A matrix  $A$  is called orthogonal if  $AA^T = A^T A = I$ , i.e.,  $A^T = A^{-1}$

Example: prove that  $A = \begin{bmatrix} 1/\sqrt{3} & 1/\sqrt{6} & -1/\sqrt{2} \\ 1/\sqrt{3} & -2/\sqrt{6} & 0 \\ 1/\sqrt{3} & 1/\sqrt{6} & 1/\sqrt{2} \end{bmatrix}$  is orthogonal.

Since,  $A^T = \begin{bmatrix} 1/\sqrt{3} & 1/\sqrt{3} & 1/\sqrt{3} \\ 1/\sqrt{6} & -2/\sqrt{6} & 1/\sqrt{6} \\ -1/\sqrt{2} & 0 & 1/\sqrt{2} \end{bmatrix}$ . Hence,  $AA^T = A^T A = I$ .

Can you show the details?

We'll see that orthogonal matrix represents a rotation in fact!

## 1.4 Properties of matrix

- $(AB)^{-1} = B^{-1}A^{-1}$
- $(A^T)^T = A$  and  $(\lambda A)^T = \lambda A^T$
- $(A + B)^T = A^T + B^T$
- $(AB)^T = B^T A^T$

## 1.4 Properties of matrix

Example: Prove  $(AB)^{-1} = B^{-1}A^{-1}$ .

Since  $(AB)(B^{-1}A^{-1}) = A(BB^{-1})A^{-1} = I$  and

$(B^{-1}A^{-1})(AB) = B^{-1}(A^{-1}A)B = I$ .

Therefore,  $B^{-1}A^{-1}$  is the inverse of matrix  $AB$ .

# 1.5 Determinants

## Determinant of order 2

Consider a  $2 \times 2$  matrix:  $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$

- Determinant of  $A$ , denoted  $|A|$ , is a number and can be evaluated by

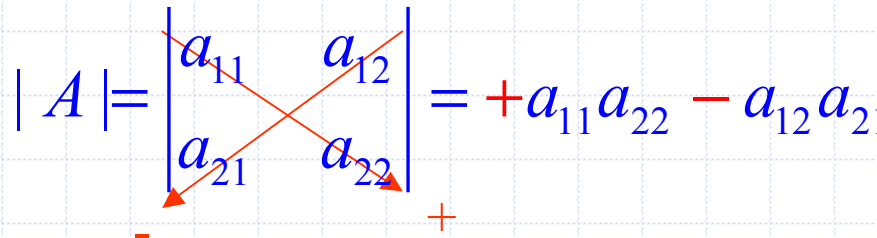

$$|A| = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{12}a_{21}$$

# 1.5 Determinants

## Determinant of order 2

- easy to remember (for order 2 only)..

$$|A| = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = +a_{11}a_{22} - a_{12}a_{21}$$

Example: Evaluate the determinant:  $\begin{vmatrix} 1 & 2 \\ 3 & 4 \end{vmatrix}$

$$\begin{vmatrix} 1 & 2 \\ 3 & 4 \end{vmatrix} = 1 \times 4 - 2 \times 3 = -2$$

## 1.5 Determinants

The following properties are true for determinants of any order.

 If every element of a row (column) is zero,

e.g.,  $\begin{vmatrix} 1 & 2 \\ 0 & 0 \end{vmatrix} = 1 \times 0 - 2 \times 0 = 0$ , then  $|A| = 0$ .

   $|A^T| = |A|$

← determinant of a matrix  
= that of its transpose

   $|AB| = |A||B|$

## 1.5 Determinants

Example: Show that the determinant of any orthogonal matrix is either  $+1$  or  $-1$ .

For any orthogonal matrix,  $AA^T = I$ .

Since  $|AA^T| = |A||A^T| = 1$  and  $|A^T| = |A|$ , so  $|A|^2 = 1$  or  $|A| = \pm 1$ .

## 1.5 Determinants

For any 2x2 matrix  $A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$

Its inverse can be written as  $A^{-1} = \frac{1}{|A|} \begin{bmatrix} a_{22} & -a_{12} \\ -a_{21} & a_{11} \end{bmatrix}$

Example: Find the inverse of  $A = \begin{bmatrix} -1 & 0 \\ 1 & 2 \end{bmatrix}$

The determinant of A is -2

Hence, the inverse of A is  $A^{-1} = \begin{bmatrix} -1 & 0 \\ 1/2 & 1/2 \end{bmatrix}$

How to find an inverse for a 3x3 matrix?

## 1.5 Determinants of order 3

Consider an example:  $A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}$

Its determinant can be obtained by:

$$\begin{aligned} |A| &= \begin{vmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{vmatrix} = 3 \begin{vmatrix} 4 & 5 \\ 7 & 8 \end{vmatrix} - 6 \begin{vmatrix} 1 & 2 \\ 7 & 8 \end{vmatrix} + 9 \begin{vmatrix} 1 & 2 \\ 4 & 5 \end{vmatrix} \\ &= 3(-3) - 6(-6) + 9(-3) = 0 \end{aligned}$$

You are encouraged to find the determinant by using other rows or columns

## 1.6 Inverse of a 3×3 matrix

Cofactor matrix of  $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 4 & 5 \\ 1 & 0 & 6 \end{bmatrix}$

The cofactor for each element of matrix A:

$$A_{11} = \begin{vmatrix} 4 & 5 \\ 0 & 6 \end{vmatrix} = 24 \quad A_{12} = -\begin{vmatrix} 0 & 5 \\ 1 & 6 \end{vmatrix} = 5 \quad A_{13} = \begin{vmatrix} 0 & 4 \\ 1 & 0 \end{vmatrix} = -4$$

$$A_{21} = \begin{vmatrix} 2 & 3 \\ 0 & 6 \end{vmatrix} = -12 \quad A_{22} = \begin{vmatrix} 1 & 3 \\ 1 & 6 \end{vmatrix} = 3 \quad A_{23} = -\begin{vmatrix} 1 & 2 \\ 1 & 0 \end{vmatrix} = 2$$

$$A_{31} = \begin{vmatrix} 2 & 3 \\ 4 & 5 \end{vmatrix} = -2 \quad A_{32} = -\begin{vmatrix} 1 & 3 \\ 0 & 5 \end{vmatrix} = -5 \quad A_{33} = \begin{vmatrix} 1 & 2 \\ 0 & 4 \end{vmatrix} = 4$$

## 1.6 Inverse of a $3 \times 3$ matrix

Cofactor matrix of  $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 4 & 5 \\ 1 & 0 & 6 \end{bmatrix}$  is then given by:

$$\begin{bmatrix} 24 & 5 & -4 \\ -12 & 3 & 2 \\ -2 & -5 & 4 \end{bmatrix}$$

## 1.6 Inverse of a 3×3 matrix

Inverse matrix of  $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 4 & 5 \\ 1 & 0 & 6 \end{bmatrix}$  is given by:

$$A^{-1} = \frac{1}{|A|} \begin{bmatrix} 24 & 5 & -4 \\ -12 & 3 & 2 \\ -2 & -5 & 4 \end{bmatrix}^T = \frac{1}{22} \begin{bmatrix} 24 & -12 & -2 \\ 5 & 3 & -5 \\ -4 & 2 & 4 \end{bmatrix}$$

$$= \begin{bmatrix} 12/11 & -6/11 & -1/11 \\ 5/22 & 3/22 & -5/22 \\ -2/11 & 1/11 & 2/11 \end{bmatrix}$$
