# Application of Health Assessment NUR 225

# Module Three Physical examination of Head and Neck

# **Physical Examination techniques for head and neck**

- 1- Prepare patient and environment
- 2- Obtain health history
- 3- Prepare equipment needed as listed in the lecture

#### 1- Assessment technique: The Head

# Objective data normal range of findings Abnormal findings

#### **Inspect and Palpate the Skull**

General size and shape

#### <u>Size</u>

Note the general size and shape.

Normocephalic is the term that denotes a round symmetric skull that is appropriately related to body size.

#### **Shape**

To assess shape, place your fingers in the person's hair and palpate the scalp.

The scalp normally feels symmetric and smooth. There is no tenderness to palpation.

Use a gentile rotating motion with finger tips. Begin at the front and palpate down the midline.

Palpate each side of the head then occipital region for occipital lymph.

Palpate the joint as the person opens the mouth and note normally smooth movement with no limitation or tenderness.

#### **Inspect the Face:**

Note facial expression and its appropriateness to behavior or reported mood. Anxiety is common in the hospitalized or ill person.

Although shape of facial structures may vary among races, they should always be symmetric, eyebrows, palpebral fissures, nasolabial folds, and the creases extending from the nose to each corner of the mouth.

#### **Deformities:**

Microcephaly (abnormally small head) Macrocephaly (abnormally large head) acromegaly (Paget's disease)

Crepitation, limited range of motion or tenderness.

Hostility or embarrassment. Tense, rigid muscles may indicate anxiety or pain; a flat affect may indicate depression; excessive smiling may be inappropriate.

Marked asymmetry with central brain lesion (brain attack) or with peripheral cranial nerve VII damage (Bell's Palsy).

Note any abnormal facial structures (coarse facial features, exophthalmos, changes in skin color or pigmentation), or any abnormal swelling. Note any involuntary movements (tics) in the facial muscles, normally none occur.

Edema in the face occurs first around the eyes (periorbital) and the cheeks where the subcutaneous tissue is relatively loose.

#### **Inspect External Ocular Structures (The Eye)**

Size, placement, alignment All three should be symmetrical

# Eyebrows

Normally eyebrows are present bilaterally, move symmetrically as the facial expression changes, and have no scaling or lesions.

Exopthalamus – abnormal protrusion of the eyeball

Absent lateral third of brow with hypothyroidism.

Unequal or absent movement with nerve damage.

Scaling with seborrhea.

<u>Inspect lashes</u> for hair distribution and growth Short Evenly spaced upper lashes curl upward and lower lashes curve downward and away from eye Unequal distribution of hair

#### **Eyelids**

When eye is open the upper lid should fall between the upper iris and top portion of pupil.

The skin is intact without redness, swelling, discharge, or lesions.

Lid lag with hyperthyroidism Incomplete closure of lids can cause damage to cornea

Sclera

<u>Conjunctiva</u> and sclera should be white and free from nodules or swelling

Yellow sclera (Jaundice)
Pale palpebral conjunctiva (anemia)
Increased number of blood vessels
(inflammation)

Ptosis – drooping of upper eye lid

#### **Eyeballs**

The eyeballs are aligned normally in their sockets with no protrusion or sunken appearance. Blacks normally may have a slight protrusion of the eyeball beyond the supraorbital ridge.

Eyeballs look moist and glossy.

Explain procedure to the patient then put on examination gloves and keep his eyes closed , gently palpate eyelids for tenderness, mass & swelling, Eye ball firm Feeling touch sensation

Exophthalmos (protruding eyes) and enophthalmos (sunken eyes)

#### **Pupil**

Note size, shape and equality of pupils Round, clear and equal

Test pupillary light reflex, darken the room and ask the person to gaze into the distance. (This dilates pupils)

<u>Test for accommodation</u> by asking the person to focus on a distant object. This process dilates the pupils. Then have the person shift the gaze to near object, such as your finger held about 7-8 cm from the nose, a normal response is papillary constriction. Record normal response to these maneuvers s PERRLA,

or Pupils Equal, Round, React to Light and Accommodation.

#### **Testing visual field**

This test is used to evaluate the peripheral extent of visual field.

#### **Testing visual acuity**

Ask patient to sit or stand 4-6m from Sellen-chart and cover the left eye with opaque card .Ask patient to read the letters on one line of the chart and then to move downward to increasingly smaller lines until he can no longer discern all of the letters Repeat the test with the other eye.

#### **Testing corneal reflex**

By lightly touching the cornea with wisp of cotton. **Blinking is normal reaction** 

#### Testing eye ball movement

Ask patient to follow the object with his eyes Without moving his head. Nurse moves the object to each of the six cardinal positions, returning to the midpoint after each movement.

#### **Inspection of the Ear**

Location / Alignment hygiene
The top of the ear should be in a straight line with the corner of the eye
No swelling or thickening

#### Discharge or odor

May be caused by a perforated tympanic membrane, foreign body, exudates or wax

<u>Inspect</u> ear canal (external auditory canal &tympanic membrane) by using otoscope .The auricle is gently pulled upward and backward to straight the ear canal.

resting adult 3mm-5mm
Changes in pupils can indicate central nervous system injury
Observe for cataracts

Absence of constriction or convergence.

Asymmetric response.

Hemianopia (loss half of visual field)

Blindness, Myopia (impaired distant vision) Presbyopia (Impaired Near vision).

No reaction

Microtia – small ears
Macrotia – Larger than normal ears
Edema
Redness – indicates inflammation
Crusts over external area – eczema , contact
dermatitis

Purulent otorrhea – otitis externa or media Frank blood or clear watery drainage –especially after trauma - possible skull fracture Foreign body – loss of hearing <u>Palpate</u> auricle for texture and pain sensation on movement. Moveable without pain. The auricle is firm in texture

<u>Palpate</u> mastoid area behind ear for tenderness. No tenderness

#### **Hearing acuity tests**

#### Weber's test:

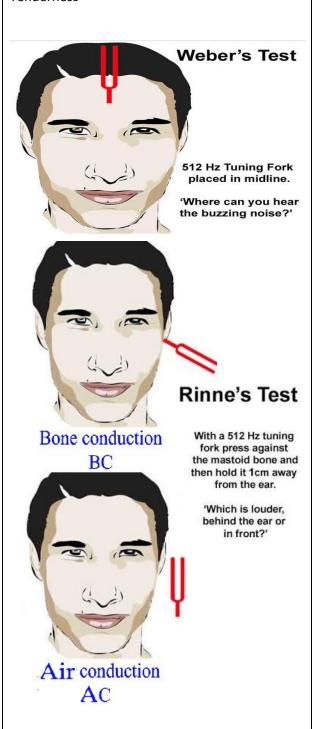

Uses to evaluate bone conduction.

#### **Rinnes Test:**

Uses to evaluate air conduction of the sound

Moveable with pain

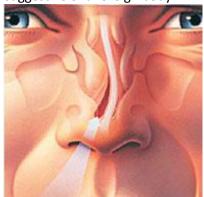

#### **Tenderness**

#### Inspection of the Nose

Shape
Symmetry
Patency
Mucosal Integrity
Should be pink and moist
Septum should be straight

Erythema and / or discharge from one side of the nares is suggestive of a foreign body

#### <u>Palpate</u> frontal and maxillary Sinus for tenderness.

#### \*Frontal

Place your thumbs above the patient eyes just under the bony ridges of the upper orbits and place your fingertips on his forehead

#### \* Maxillary

Gently press your thumb on each side of the nose just below cheek bones

#### **Test Olfactory nerve**

Ask patient to close his eyes and block one nostril and inhale a familiar aromatic substance through the other nostril

## **Inspect and Palpate the Mouth**

#### <u>Lips</u>

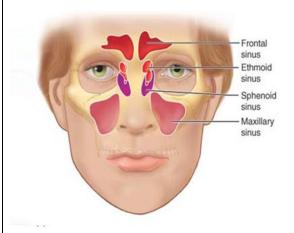

Integrity Symmetry Color

Moist, soft and pink

Gum- color ,lesion

<u>Teeth</u> – should be in good condition

<u>Mucous Membrane</u> – colour, texture, discharge, swelling

In light skinned people circumoral pallor occurs in shock and anemia

Cyanosis with hypoxemia and chilling Cherry red lips with carbon monoxide poisoning, acidosis from aspirin poisoning or ketoacidosis

History helps to determine if oral lesions have infectious, traumatic, immunological, or malignant etiology

Dysphagia – occurs with many conditions, gastroesophageal reflux, pharyngitis, stroke, neurological diseases, esophageal cancer

<u>Tongue</u> – size, colour, thickness, lesions, moisture, symmetry

Palpate the tongue and floor of mouth with a gloved finger. Pink ,free from ulcer, nodules

**Pharynx** – inflammation, exudates, masses . press a tongue blade firmly upon the-tongue-for visualization-of-the pharynx

roof of mouth for color
and architecture of hard palate

#### Inspect and palpate the NECK

#### Symmetry

Head position is centered in the midline, and the accessory neck muscles should be symmetrical. The head should be held erect and still.

#### **Range of Motion**

Note any limitation of movement during active motion, ask the person to touch the chin to the chest, turn the head to the right and left, try to touch each ear to the shoulder (without elevating shoulders), and to extend the head backward. When the neck is supple, motion is smooth and controlled.

**Test muscle strength** and the status of cranial nerve XI by trying to resist the person's movements with your hands, as the person shrugs the shoulders and turns the head to each side.

\*Inspect thyroid gland for symmetry, visible mass.
You should stand in front of the client & Ask client to sip some water and swallow. Symmetrical, no mass.
Thyroid gland ascends normally during swallowing & not visible, Except in extremely thin person

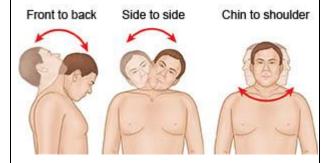

White patch

Untreated strep throat may lead to the complication of rheumatic fever

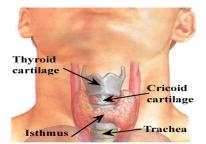

Pigmentation-Thrush on the palate.

Head tilt occurs with muscle spasm. Rigid head and neck occur with arthritis.

Note pain at any particular movement. Note limited movement due to cervical arthritis or inflammation of neck muscles.

Thyroid enlargement may be a unilateral lump, or it may be diffuse and look like a doughnut lying across the lower neck.

Palpate thyroid by standing behind the client. Put your hands around his neck with your finger tips on the lower half of the neck over the-trachea.

#### **Inspect External jugular veins**

Observe with patient sitting and then lying at 30-45 angle.

**Normal finding:** Jugular veins should be flat, without sign of distention

Distention Heart failure

#### **Lymph Nodes**

Using gentle circular motion of your finger pads, palpate the lymph nodes.

Use gentle pressure because strong pressure could push the nodes into the neck muscles.

If any nodes are palpable, note their location, size, shape, delimitation (discrete or matted together), mobility, consistency, and tenderness.

Cervical nodes are often palpable in healthy persons, although, this palpability decreases with age. Normal nodes feel movable, discrete, soft, and non tender.

Lympadenopathy is enlargement of the lymph nodes (> 1 cm) due to infection, allergy, or neoplasm.

The following criteria are common clues but are not definitive in all circumstances.

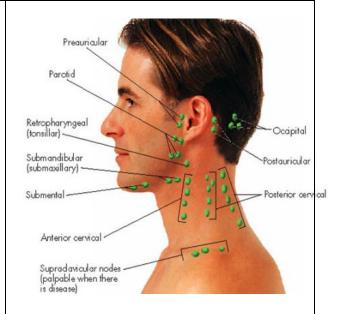

Acute infection – nodes are bilateral, enlarged, warm, tender, and firm but freely movable. Chronic inflammation e.g., in tuberculosis the nodes are clumped.

Cancerous nodes are hard, unilateral, nontender, and fixed.

Nodes with HIV infection are enlarged, firm, nontender, and mobile. Occipital node enlargement is common with HIV infection. Painless, rubbery, discrete nodes that gradually appear occur with Hodgkin's lymphoma.

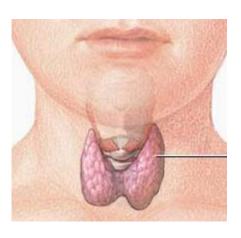

Preauricular - In front of the ear
Postauricular - Behind the ear
Occipital - At the base of the skull
Tonsillar - At the angle of the jaw
Submandibular - Under the jaw on the side
Submental - Under the jaw in the midline
Superficial (Anterior) Cervical over and in front of the sternomastoid muscle
Supraclavicular - In the angle of the sternomastoid and

the clavicle

#### Trachea

Normally, trachea is midline, palpate for tracheal shift. The space should be symmetric on both sides. Note any deviation from the midline.

#### **Conditions of tracheal shift:**

The trachea is pushed to the unaffected (healthy) side with an aortic aneurysm, a tumor, unilateral thyroid lobe enlargement, and pneumothorax.

The trachea is pulled toward the affected (diseased) side with large atelectasis, pleural adhesions, or fibrosis.

# **Quick Quiz**

# Test Your Knowledge!

Ptosis is drooping of the lower eye lid     a. True     b. False
<ul><li>2. The top of the ear should be in line with the corner of the eye</li><li>a. True</li><li>b. False</li></ul>
<ul><li>3. Cyanosis can occur with shock.</li><li>a. True</li><li>b. False</li></ul>
<ul><li>4. A trachea pushed to the unaffected side results from a large atelectasis, pleura adhesions, fibrosis</li><li>a. True</li><li>b. False</li></ul>
5-Weber and Rinns tests are used to examine vision acuity
a. True b. False
6- Blinking is the normal response for corneal reflex
a. True b. False

# Nursing health assessment documentation format

## Head &neck (adapted from KFSH &RC)

<u>Instructions:</u> Circle or fill in the blanks with actual physical assessment findings. WNL=Within Normal Limits for age. Mark items which require additional documentation with an asterisk (\*) and document in the Nurse's Notes sections of the Daily Nurses Record.

# Application of Health Assessment NURS 225

Medical-Surgical Nursing

## Performance checklist

## Head &Neck

# The student nurse should be able to:

	Competency Level						
Performance criteria	Trial 1		Trial 2			Comment	
	Done correctly	Done with assistance	Not Done	Done correctly	Done with assistance	Not Done	
-Collect appropriate objective data about head and neck related to general survey.							
-Collect appropriate subjective data related to about head and neck.							
Physical examination							
		HEAD					
Inspection							
1-Inspect hair for quantity, distribution and texture. 2-Observe face for skin color, hair distribution.							
PALPATION							
3-Palpate scalp for tenderness and mass 4-Palpate the skull for nodules or mass.							
	EYE	AND VISIO	N				
Inspection							
1-Inspect eyebrows and lashes for symmetry, distribution of hair. 2-Inspect lid margins for color, scaling, erythema. 3-Inspect sclera for color. 4Inspect pupils for size, shape and symmetry 5-Test pupil for accommodation. 6-Test visual acuity 7- Corneal reflex							

0 D '1 1' 1.		I			1	
8- Pupil react to light 9- Eyeball movement						
10- Peripheral field acuity						
10 Tempheral field acuity						
PALPATION						
- Palpate eyeball for tender and feeling						
sensation.						
	EAD A	ND HEARN	IING			
	EAN A	ND HEARIN	iiivG			
Inspection						
1-Note auricle for <b>texture</b> , <b>lesion</b> .						
2-Inspect opening of the ear canal for						
discharge, redness or odor.						
Dolnation						
Palpation						
3-Palpate auricle and mastoid area for pain						
sensation.						
4-Hearing field tests						
Webers test Rinnes test						
Rinnes test	NOCE	AND SINU	CEC			
	NUSE	AND SINU	3E3			
1-Inspect the nose for position, symmetry,						
and color, dischargedeformity.						
and color, dischargedelormity.						
2-Inspect for nasal obstruction and air way						
patency						
Palpation						
3-Palpate frontal and maxillary sinus for						
tenderness.						

MOUTH							
Inspection							
1-Inspectlips and gums for Color, swelling tenderness and ulcer.							
2-Inspect the teeth for number and condition.							
3-Inspecttongue for size, color, surface and							
mid-line protrusion.							
Palpation							
<b>4-Palpate the tongue</b> and floor of mouth							
with a gloved finger for redness,							
ulceration, nodules, white.							
		Pharynx					
Inspection							
5-Inspect uvula and pharynx for color and							
moisture.							
6-Note tonsils for size, inflammation,							
swelling, discharge.							
		NECK					
Inspection							
1-Inspect the neck for symmetry, scars, or							
other lesions							
2-Inspectthyroid gland and lymph node							
forsize and visible mass.							
3-External juglar vein							
4-Trachea shift							
Palpation							
Palpate thyroid							
Palpation of lymph nodes
